While essentially correct, this is not strictly true. You need open the
TripMate and dd the external power jumper that DeLorme will supply on
request. The unit will them run happily on 5-6 V, but I don't think it has
a enough regulator to run off vehicle battery. I believe this uses pin 6
or 9 as the DC feed, but I can't remember. An ohmmeter will supply the
answer in a few seconds. Delorme sells a handy little cabe for $39.95
that you can make for $5. It steals 5 V from the keyboard connector.

Then there will be only one copy of this message.
Generated by "reply to all" in eudora 5.1, removing bob's address from the
TO: field, and leaving the APRSSIG address in the TO and CC fields.

On other messages, I have seen different versions of the list name in the
TO and CC fields, that that is likely what is causing the problem.

Rendered body type: text/plain

I use Eudora 3.0 pro. Under the Options pulldown is a checkbox labled

Put original to: recipients in cc: field

When unchecked a reply to all does as the list is configured in Stans message.

When checked the following occurs:

TO: Original sender

CC: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>, TAPR APRS Special Interest Group <aprssig@lists.tapr.org>

YES THERE ARE TWO VERSIONS

This is, as I noted in my first post, the real problem -- mis-configured email clients not the list software. It is impossible to configure a list to satisfy every user so it is the responsbility of the user to LEARN how the list works and adapt.

My suggestion is to explore the settings in your prefered client and look for something similar it may solve your problem.

Some of the worst offenders for mis-configuration are the various versions of the MS Lookout Viral Vector clients.

This will be my last post on the subject. I offered the first as a tip to help someone look for a solution. I am very familar with my software and its functionality including the delete key. Even better than the delete key is the concept of a kill filter.

The TripMate brings in RI (pin 9 on the DB-9) to the center pin between the power and ground where the battery holder connects. What DeLorme does with their external power adapter is feed +6v up the RI wire. Then you pull the battery connector, and jumper the center pin to the +V pin.

Opening the case to get at the battery compartment is a far cry from popping the 'sealed' screws and getting at the PCB.

In my case, I made up a male/female DB-9 in a shell connector that did the loopback for self-start on the data line. It also tied all the PC side signals valid for loopback, so I could look at the data stream with terminal programs. Then I brought out a pigtail from the DB-shell that had a mini-din connector on it so I could plug it into my laptop to steal the 5v for an external keyboard. No regulator necessary.

What I found was that it worked fine. As long as I didn't let the laptop do any PM to the keyboard!

However, the TripMate was not NEAR as sensitive on 5v as it is at 6v. Longer lockup times were common. I've been told that they operate VERY well at 8v. But that just over 8v and a fraction they will smoke

with no warning! I believe there is circuitry directly connected to the
power and there is in fact no regulator in the TripMate. At least, not on
some of the circuitry.

Mike

Rendered body type: text/plain

You cannot change the TOCALL, other program are NOT SUPPOSED to allow
you to change it either. WinAPRS should be sending out APRSW or
APWxxx where the xxx is the version number. This is defined in the
protocol spec. MacAPRS sends out APRSM, we did have a version
previously where WinAPRS sent out APRSM instead of APRSW but that
should be fixed.

Why on earth do I want to send two messages? It's a group discussion!
That's what people are moaning and groaning about and the fix is very
simple! In my case, and I can't speak for others, when I use Reply-All, the
tapr list is in the Carbon Copy.

>
> That is what PINE does. Two key strokes: R for REPLY and Y for "yes,
> to-all".. I certainly am not suggesting others use ancient PINE, but

I used Pine in the early 80's and not much has changed with it. It was a
PITA then, and still is. Email programs have advance in regards to user
convinence a whole bunch since then!
Normally, when you hit Reply to a group message the reply goes back to the
group. This is the norm. When you hit Reply-All it still sends the reply
to the group and a CC: to the "originator. Most all listserv's I know of
are set that way, which is what is reasonible to expect because most
software is expecting that.
Banyan, Lotus Notes, Outlook, as well as others do this. I think my Pine
did that too.

This is NOT how my machine works, or my laptop, or my work machine,
or the laptop I kept at a contract site, or the machine in the lab.

And it may NOT be a group discussion. I responded to you privately
on at least one of these, and you turned around and sent it to the list.
I
sent it private to keep it OFF the list. And I think there are valid
times
to do that.

I prefer to think of 'Reply' as meaning reply to the poster, and 'Reply
All'
as reply to the list.

> Normally, when you hit Reply to a group message the reply goes back to
the
> group. This is the norm. When you hit Reply-All it still sends the

Pine
> did that too.

Maybe normal for you, but again, on ALL the machines I use, and ALL
my list (it was more, but currently only 2 'private' list and 2 HAM radio
list, the TAPR and QRP) NONE of the list or machines I use operate
the way you describe.

On EVERY platform, on all 4 current list (and on others that I have
dropped in the past!) hitting REPLY went to the original submitter and
ONLY the original submitter. Hitting REPLAY ALL sends to the
original submitter followed by a semi-colon, followed by the list name
all in the "To:" field. There is NOTHING in the Cc: or Bcc: fields.
(And they've generally worked this way for a while, except for the short
time Stan was experimenting with how to improve the functionality
and decided to come back to this.)

Please don't confuse how YOUR system works with how you think
EVERYBODYs systems works, or how you THINK they should work.

Mike

Bob,

The AMSAT Field Day rules are restrictive in the area of APRS for
PCsat and ISS digipeating if you have not read those rules. They can
be found at http://www.amsat.org/amsat/activities/amsatfd.html

The text below is verbatim from the AMSAT rules concerning APRS
message contacts via ISS and PCsat:

"Satellite digipeat QSO's and APRS short-message contacts are worth three
points each, but must be complete verified two-way exchanges. Remember,
only one digipeat contact is allowed for the ISS and one for PCSat."

Since the ARRL rules do not single out PCsat and ISS, there is some
discontinuity that may create some concern if somebody acknowledges
more than one station via these orbiting digipeaters.

73's.

If your DOS machine is running IBM's version of DOS (IBM-DOS 5 or better) I believe you should have available some basic LAN functions such as connecting to shares via the NET USE \\sharedrive from the CMD prompt. If so then you can probably use the

```
NET TIME \\servername /set /Y
```

command to set your time. If you leave the /Y switch off then you will be prompted with a comparison of the two machine's times and can then select to sync your clock to the time server or not.

At the DOS prompt type;

```
NET TIME /?  <enter>
```

for help, and you should see something similar to this:

```
Z:\>net time /?
The syntax of this command is:

NET TIME
[\\computername | /DOMAIN[:domainname] | /RTSDOMAIN[:
         [\\computername] /QUERYSNTP
         [\\computername] /SETSNTP[:ntp server list]
```

Hope this helps. Of course the machine you are syncing to needs to be

accurate. Try the free time server software at www.analogx.com , look
under network tools/software.

73...Bob

Message-ID: <LYR842-84802-2002.06.13-16.35.13--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Well, I was helping my friend WD4GYW get things setup for his ride to
Minnesota next week. I offered my Kam version 5 for the HF APRS and got a HSP
cable from another friend to use. He has a new Kenwood 2000 a really nice
radio. With the outbacker on the truck it would really do a nice job. Trouble
came when we tried to tune to 10.151. The radio wont TX there as it is said
to be out of band in the docs. Now ain't that a hoot.

I guess he will be stuck with 14.105?

I listened there and found some APRS going on. Anyone know if there is
gateway cover on that band or not. There are a few of use that would like to
take this ride with him and who knows some of the other APRS's around the
country might like to follow his progress as well.

Ok, lets have a few comments about all this and any ideas about the Kenwood
2000.

Read HF.DOC from the APRS/DOS documentation, and you'll see how to
deal with this situation, by tuning using UPPER sideband on a lower
(in band) dial frequency...

Rendered body type: text/plain

```
Just now, with a little plodding from friend, I turned off the Mic-E expanding
on the jnos.org APRSD server.  Rumor has it that I'm not the last to do so.

At one time - it was a good thing for clients to expand the Mic-E style
packets.  No longer.

We should be able to come up with some magic sniffer or MySQL query
for findu to show all the encoded packets and probably even trace back to
see where they're coming from.

73,
Bill - WA7NWP

If we have "EMERGENCY MESSAGES", wouldn't it be good to have a
corresponding "EMERGENCY CLEAR" message?   Also how about a
procedure that a responding station can use to broadcast (beacon) that
"I'm handling this message."   As it is now, you don't know if a dozen
or zero folks are responding.

Bill

Rendered body type: text/plain

IGates:

We have just lost one of our primary East coast USA PCsat IGates temporarily and since the next week is our only remaing week of full sun this summer, it would be nice to have a replacement. If anyone East of the Mississippi has a good low-loss antenna system and IGate that they can temproarily QSY over to 145.825 MHs for the next week, it would be appreciated. Thanks.

We will be trying to get GPS data from the onbaord GPS and we depend on the IGates to pick up the 1200 baud data on 145.825. The engineering GPS data will be at 9600 baud on 144.39 next week. SO if you can capture 9600 baud files on that frequency (worldwide), please send them to me... thanks

> points each, but must be complete verified two-way exchanges. Remember,
> only one digipeat contact is allowed for the ISS and one for PCSat."

Wow, I had forgotten that. I guess then since it is impossible to have a contact and send LESS than one packet, that ONE QSL packet is the limit. But since in the APRS AUTO-QSL mode, ONE packet can have up to 8 QSL callsigns in it, then I see no problem with everyone limiting themselves to ONLY ONE QSL packet, but they can list as many as 8 calls in their packet if they wish to improve their probabilities of a 2-way.

They can only count ONE QSO, and it only counts if they have both QSL'ed
another call and the other call has QSL'ed them. But this rule does not
prohibit the number of calls you put in your "SINGLE" authorized packet...
or at least that seems to be in the spirit of the objectives of Field Day.

This way, potentialy 64 stations could have valid two-ways on a single
pass with a theorietically minimum of only 64 packets on the air. But
doing it the conventional CONNECTED way, would take 19,845 successful
packets! Impossible.

DETAILS:

Here is how the AMSAT rules define a verified 2-way exchange as taking 3
packets:

1. W6NWG de KK5DO 2A STX
2. KK5DO de W6NWG QSL 5A SDG
3. W6NWG de KK5DO QSL

But since PCsat and ISS are UI digipeats that do not fit the "CONNECTED"
packet protocol model, here is how I interpret that relative to how we
have been doing space digipeter and FD APRS contacts in the past:

1. Is yours and other's APRS position reports with ARRL exchange in it
2. Is your BLN1CQFD bulletin containing the stations you are QSLing
3. Is HIS BLN1CQFD bulletin with YOUR callsign in it..

These are concise, efficient, verified and verifiable 2-way contacts.
(But you can only count one completed 2-way per bird).

Rendered body type: text/plain

Unfortunately, the MAIL CLIENT doesn't necessarily handle things the way
you'd like. It's not a perfect world, and some of us cannot anticipate
just how you think things should be handled.

The List Manager software (pick your flavor), as configured by the list
administrator (Wave to the people, Stan), set the standard for how the
headers are dealt with.

IF the headers are modified to make reply-to: the list, that's done in
the list software, properly, and should not be done in misbehaving mail
clients. If the reply-to: header is absent or unchanged, then the reply
would go to the originator.

Some lists, not conforming to the real internet norms, modify the From:
header, and not the reply-to: header. These lists will make you reply
to them regardlesss, as they've modified the originating site. This is
NOT good: If I have to troubleshoot a problem and you've obfuscated the
origiation site, it makes my life unpleasant, and I'll tell the person
with problems, to take a hike.

What you're promoting is orthogonal to the intent of most of the list
software I'm aware of.

As Stan has indicated, the changes you'd prefer were instituted
recently. Over the course of an interminable period (couple of weeks?
Month?) I was prepared to completely leave the list, because it's not
what I expected. I prefer to respond directly most of the time, as my
technical responses have caused some consternation in some folk. Rather
than causing them grief, I've just used the NORMAL behavior of the list
to my advantage.

Stan, Thanks again for putting the list software back to rights.

Its built-in to the APRS system as originally defined::

Anyone can cancel any such packet on APRS. All they need to do is send an APRS OBJECT with an exact match to the callsign of the original. This will show ALL stations that your station is taking over reporting responsibility for that callsign. THEN send a KILL OBJECT for that same object.

This will kill the original station callsign. In APRSdos, a killed station/object turns to a barely perceptible dark gray ICON and no callsign on the map and it will be clearly marked as a killed object and with the callsign of the station who took over reporting and killed it... But it is retained (as a clearly marked KILLED obejct for future reference if needed)... This accoutability is fundamental to OBJECT reporting and Killed objects in APRS.

That is how APRS is supposed to work anyway. But it has recently come to my attention that not all APRS software implemented OBJECTS and KILL OBJECTS properly due to some potential for missinterpretation of the SPEC. The original APRS design defined objects and stations with the same "name" as identical and indistinguishable (except that the sender of an OBJECT is always associated with an Object). The above example is just one of the reasons for the interchangeablity of stations and objects.

Bob and the list,

I have a good system
Dedicated computer with cable modem
Dedicated radio feeding
1/4 wave ground plane at 20 feet
25 ft run of low loss coax

I will QSY it over tomorrow. Using a cable modem I should be able to provide a full time feed for the duration.

Questions will APRS + be sufficient for the IGate function or is there a special version of APRSdos required? I am willing to D/L if needed.

APRSPLUS works good for PCSAT...   I'm going to turn mine on for the
next week too to catch a few extra packets from the other coast.

One trick is to go to Setup-Settings and the IGATE tree selection.  Set

   AddUniqueID=1

and

   UniqueID=WA7NWP,I

(Use your call...)

Then when you check on  http://pcsat.findu.com - you'll see which packets the
system has heard through your IGATE.

73,
Bill

I'm OK! I don't know what happened exactly. I am running a D700 in
the Jeep and did not change it to Emergency!. I did start the
vehicle with the radio on (I know... BAD BOY!) and the radio did go
down for a moment... I guess it could have scrambled for that
moment.

I just got a phone call on it so I am investigating it more.

Thanks,
Eric KF4OTN

The more important thing to fix here is to get the local IGate to stop
converting Mic-E packets. All of the APRS IGate software can now pass the
original 8 bit Mic-E formats to the internet, so we need to have all
IGates stop doing the conversion locally (which in some implementations
separates the STATUS text from the POSITION format).

Bob,
I'm pretty sure that my IGATE (KF4OTN) was the one that sent it to
the internet...  I'm running WinAPRS 2.5.1 as my IGATE...  how do I
stop it from converting?

Bob, I just switched to UI-View about a week ago. From what I can see, it
does not convert the Mic-E packets.
What I REALLY like about UI-View (from an Igate point of view) is the Igate
Window.
This window is split in two. One side shows RF to Inet packets and the
other side shows Inet to RF packets!
Very Very nice feature for me!! WinAPRS was sending about 4 packets to the
Inet for every Mic-e packet received. I just could not stand knowing that.
Ui-View also appends my call to the RF to Igate packets....which I really
like. It makes Igates more responsible, IMHO and is a good tool for the
guru's tracking trouble.
I got to tell you folks, if you just run an Igate, try the 32 bit version of
UI-View. Roger is great at helping and the darn thing actually does what
you tell it to do. That was certainly new to me!!

40.50 MHz (36F3) is the Army Air Corps (man it's good to see the ole wing and prop back) guard channel.

That is WA4MJF-1 which is an APRSDAT station. It send info to the satelite radios (D-7 etc) so that they can work the birds that are easy to work without a complex skyhook.

You can find more info at www.TEARA.org

WOW!! When I wrote this (the message in question), you can SEE it was June 10 at 2:33pm. But it JUST now showed up in my list messages at 8:21pm tonight, June 13th!

I know that there can be some weird anomalies when individual messages get retried and 'out of order', but I think this is the worst one I've seen happen.

Now, the question becomes... Was it ME getting TO the list, or my post to the list getting BACK to ME?

I think the WARTHOG is the only USAF fixed wing
with VHF Lo Band.  Interstin'ly enough the 74th FW down
at Pope (or at least where they're based) has 40.50 MHz
in their frequncy list.

40.50 MHz (36F3) is the Army Air Corps (man it's good to see the ole wing and prop back) guard channel.

That is WA4MJF-1 which is an APRSDAT station. It send info to the satelite radios (D-7 etc) so that they can work the birds that are easy to work without a complex skyhook.

You can find more info at www.TEARA.org

What exactly do you have running there at your station?!? I see sats and DX information on SATS and see the bullitens that you have running. Very impressive.

Also, what is 40.50?!? I recognized all the other frequencies but that one.

Eric KF4OTN

I just got back from vacation tonight (6/13). I was reading mail while away
and last downloaded mail 6/12 in the evening. Tonight I had a dozen
messages from the list that I'd already seen, variously from the 10th
through the 12th. I thought it was some glitch because I wasn't at home -
apparently not.

Gents,

LINUX

How would I insert the date and time in front of data received from /dev/ttyS16 ?

Would you go:-
```

```
#/usr/bin/perl
open (LINE, "< /dev/ttyS16") or die "Cant open serial"
open (OUT, ">> aprs.log") or die "Cant open file"
while (<LINE>)
{
print 'date' >> aprs.log
print OUT
}
```

501. [aprssig] DIGI Identification

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 14 Jun 2002 00:22:25 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84872-2002.06.13-23.59.12--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Fellow APRS users:

We need to clean up our DIGIpeaters. I just ran a 12 hour capture of all DIGIS from the APRS feed and this is what I got. The surprising number is the total number of undesignated digipeaters that have no marking OVERLAY characters or TEXT saying what they are. THus leaving users in the dark...

Here is the breakdown of the 909 digis by OVERLAY character:

```
 11   U = does RELAY,WIDE,TRACE,WIDEn-N with NOID and other smart stuff
532   N = does RELAY,WIDE,TRACE,WIDEn-N with NOID
  3   I = does RELAY,WIDE,TRACE,WIDEn-N with ID
 86   T = does RELAY,WIDE,TRACE
  3   W = does RELAY,WIDE
 15   R = Does RELAY only
 21   \ = Makes the digi solid green meaning a WIDE,RELAY digi
```

RECOMMENDED CHANGES:

1) The "\" overlay predated 1995 and those digis are probably all RELAY-WIDE. They need to be changed to "W"

2) The digis that are JUST WIDEn-N with no RELAY nor WIDE support are unidentified. I recommend "J" for "JUST WIDEn-N".

3) Although I am pleased to see only a few digis with ID turned on, I assume there are more that are not marked with the "I" overlay. These digis overwrite the SOURCE digi with their own ID and users need to be alerted that the first digi in the path is not the source digi but the LAST digi.

Do we need any other categories?

If we can get ALL digis to use the proper OVERLAY characters, then the USERS will benefit by knowing what area they are in...

OVERLAY CHARACTERS: THe overlay character is the BYTE between the Latitude and Longitude in a standard APRS position packet...

Rendered body type: text/plain

Here are some DIGI typos I found. If your digi is listed here, you may
have a typo in your BText (or I caught a garble)

K0BOY-1	using an overlay "H" ???
K4MQF-1	using an invalid overlay of "."
KA0MR	has a leading space charactyer
KC4RNF-7	is the only THE-NET digi I found
KC6MFH-3	has an overlay "3" ???
RCHFLD	has "nn" instead of NN for NORTH/N overlay
WX9MKX	is missing the LAT/LONG separator completely...

and non USA stations

CT0XBR-3	was using decimal LAT/LONG
EA1B-8	has an extra space in the format
HI8MUH-2	using an overlay "D" ???

How about something like this:

```
#!/usr/bin/perl

require 5.004;

use strict;

my $INPUT = "test.txt";
my $OUTPUT = "test.log";

open(LINE, "< $INPUT") or die "Cant open serial";
open(OUT, ">> $OUTPUT") or die "Cant open file";

while (<LINE>)
{
my($sec,$min,$hour,$mday,$mon,$year,$wday,$yday,$isdst)=localtime(time);
    $year += 1900;
    my $date = "$year-$mon-$mday $hour:$min:$sec";

    print OUT "$date $_"
}
```

Rendered body type: text/plain

From: "Eric Christensen, KF4OTN" <kf4otn@cox.net>
> You need to use ALL of your resources available when you are in an
> emergency situation.

I still think we are missing the point here. What EXACTLY does the Position Comment of "EMERGENCY!" mean?

It could mean anything from the sender him/her-self being involved in a serious accident (I understand that really happened in MD once) to someone marking the location of an accident to someone testing their tracker.... That sure is a wide diversity of meannigs. If "EMERGENCY!" mean everything, it means nothing ....

Keith said: "As to the "bottom line" question.... it seems, if "EMERGENCY!"
is to have
any function then it should be assumed that one can expect another to
attempt to discover the nature of the emergency and act appropriately."

I would agree to the above if there was some common understanding that "EMERGENCY!" was equivalent to "MAYDAY", but it is not. I do not believe we can "assume" that "EMERGENCY!" means anything. The spec is silent on this question. There is no commonly acceptable protocol. I am not saying there should not be common protocol, on the contrary, I believe there should be! Right now the "EMERGENCY!" Position Comment sheds little, if any, light and only causes confusion. That is the whole point ... and maybe that is the value of the recent test.

Another bottom line question: If you caught a packet with the Position Comment (perhaps the Kenwood lingo for this feature says it all -- it is a position "Comment") would you feel comfortable taking the responsibility to call 911 with that information? Any 911 mavens out there want to offer an opinion as to what kind of response the typical 911 operator would offer to the following: "I just got a message on my ham radio that says there is an emergency at 40 degrees 8 minutes North and 74 degrees 58 minutes west .... Who is involed in the emergency?   I really don't know.... What is the nature of the emergency? I really don't know ... Should you send a police car? I really don't know ... An ambulance? I really don't know ... A fire truck? ...."

Also, I can't let it pass that this discussion is inspired by some cavalier attitude. Rather it is inspired from a desire to promote precision. As a post-er recently mentioned, International aggreements going back decades already give us standard protocols on this question. Maybe we should HAVE (past tense, with all those Kenwoods and dumb trackers out there the horse is WAY out of the barn on this one) considered these questions before the "EMERGENCY!" position comment was carved in stone with no real meaning ....

Peace & 73

PCsat is just like any APRS digipeater but it is on 145.825.  It responds
to RELAY, WIDE like any other APRS digipeater.  See PCsat web page below.

To IGate its packets, just set your IGate receiver to 145.825 instead of
144.39.  No other changes necessary...

509. [aprssig] RE: Can someone please explain

From: "AE5PL Lists" <HamLists@ametx.com>
Date: Fri, 14 Jun 2002 07:44:55 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84919-2002.06.14-08.21.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
First, turn off the <UI> portion of the header.  This should not be
passed to APRS-IS.

According to the APRS specification, if you wish to gate to RF the
following packet, it should look like the second line:

VK3ZV-2>APU24P,TCPIP,VK4TO*,VK4GME-3:=3801.45SI14622.66ElConnected To
Internet. {UIV32}

VK4TEC>APRS,RELAY,WIDE:}VK3ZV-2>APU24P,TCPIP,VK4TO,TCPIP,VK4TEC*:=3801.4
5SI14622.66ElConnected To Internet. {UIV32}

However, IGates today are not in compliance with the specification.
They are using the following (per instructions predating the APRS
```

specification).

VK4TEC>APRS,RELAY,WIDE:}VK3ZV-2>APU24P,TCPIP,VK4TEC*:=3801.45SI14622.66E
lConnected To Internet. {UIV32}

Third-party packets are only used in gating procedures. A digi should
never use third-party packet formats. A digi should perform per the
AX.25 specification with variations per the APRS specification.

73,

The only difference is whether the RF path of the original packet is
included in the retransmitted packet. This is still a mater of some
debate. The original document I wrote in 1998 to describe how the
messaging worked:

http://www.aprs.net/inetmsg.html

eliminated the RF path in order to keep the IGated packet short. AFAIK
all IGates implemented this method. Some RF paths get quite long,
especially some of the TRACE7-7 we see from Europe, and could make a
packet too long. In addition, changes are being discussed to provide
trace information on packets, something sorely needed. If this does
get implemented, then there needs to be even filtering of the path.

I don't recall how this got into the spec, it certainly isn't
something I would have let pass without a discussion, but my memory
fades more than it used to. It is certain to change if the APRS IS
spec is ever developed...

For now, my advice is to follow what is in use.

Steve K4HG

Instead of using 10.151 LSB, use 10.147 USB....they are the same frequency.
This is an "old" problem that is easily solved. The aprs frequency is
10.149. This is achieved by using 10.151 LSB or 10.147 USB....assuming 2 Khz
audio tones, 10.147 + 2 khz = 10.149, and 10.151 - 2kzh = 10.149.

I ran my station many years using this exact technique, because neither of
the radios I had would permit TX if the VFO said anything above 10.150.

Greetings

I have completed the change over and KC4ZGQ-2 is now set as an IGATE on 145.825.

Sorry it took a while but I HAD to watch ESPN2 and see if the US could come from behind. Alas it was not to be so we owe thanks to South Korea for trouncing Portugal or perhaps to Portugal for committing red card suicide. Next up, and down I hope, Mexico.

I have had some problems with APRS + 2.11 showing an error after running all night while connected to the Internet. The error does not seem to cause a problem so I have been ignoring it. I have increased workspace to 250000000 (not a typo) and set number of posit reports to 800000 as well as set automatic data deletion.

Any suggestions and a URL for KEPS would be appreciated although I may find it first.

That makes for short documentation :)

> To IGate its packets, just set your IGate receiver to 145.825 instead of
> 144.39. No other changes necessary...

Hmmm... so I could could retrieve pass information using a script and tune
the radio under computer control while PCsat overhead. I'd just loose
terrestial digipeating for 10 minutes or so while PCsat passed.

Has anyone done that? That would eliminate the need for a dedicated radio,
TNC, etc...

Adi

Rendered body type: text/plain

Volunteer 9600 baud downlink stations needed this week 13-20 June.

With one week to go of PCsat in full sun, we will be conducting GPS
experiments and need volunteers to capture 9600 baud downlink data on
144.39 worldwide (wherever there are control ops, USA, UK, AUS, NZ,
South Africa, Argentina).

I will be on family travel and cannot participate. Please send data to
both of the following emails:

Oliver.Montenbruck@dlr.de
sunny.leung@dlr.de

The special GPS data will be on 144.39 MHz. If the GPS is ON, there will
be 3 packets once every 30 seconds and if lucky, one packet every 3
seconds to determine spin rate...

The normal PCsat downlink remains on 145.828 where we hope the worldwide
IGates will capture the normal spacecraft telemetry.

Thanks for your support. This will probably be the last chance for
getting GPS data from PCsat.

de WB4APR, Bob

Yes, APRStk (in DOS) does all of that (for tuning a Kenwood D7 or D700
radio)...see ASTARS web page below..>

> DOS.

There is a DOS shareware utility called FIXTIME which is useful for
keeping the computer time accurate.  I have version 3.0 if you want a
copy.  Here is an extract from the documentation describing how it
works:

   Typically the real-time clock in a computer loses or gains a consistent
   amount of time.  Fixtime is a utility which compensates for this "clock
   drift" by periodically adjusting the clock based on the past history
   of clock drift on a particular computer.  Typically Fixtime is executed
   when the computer is started by running it in the \AUTOEXEC.BAT file.

I made one from these plans 5+ years ago from a brass-looking kickplate.(brass = easy to solder, al-you-minium, well..) I think it was from a bathroom door, but your local Marie Calendars should have a couple right out front;) It worked very well out in the open, but lacking a pre-amp, suffered in the abundant tree cover here in the NortWet. the performance was good down to about 30deg el. in all but the worst urban areas.

I added a mag mount to mine with a magnetron magnet and some duct tape. but with its unique aerodynamic styling, it was prone to fly off of my van at around 65MPH, attached only by its RG-58(I considered '174 too lossy w/o a pre) cable coming out of the door jamb at the A-pillar. There's nothing like cruising down the freeway, when out of your peripheral vision you see something large fly up and BANG the side of your vehicle right behind your head. You're sure to soil your pants if this happens when the window is down. I retired mine when I accuired several SVee-6 antennas.

The 5V on the top patch is a problem. Garmin was smart enough tho, to protect the ant. power from shorted cables. My GPS45 would just turn itself off when this happened.(not very often) I think that a powdercoat in some bright color would look good and add the needed isolation. A J0 cap to uncouple the ant. DC would be a good addition to the plans as well.
(for those scratching their heads, a J0 cap is a capacitor whose value and lead inductance make it look series resonant(J=0) at the frequency of interest. I know they dont have leads, but surface mount caps are used at microwave freqs.)

drop me a note if you'd like to see pics of mine.

Subject: GPS Patch Antenna
From: "Mike Yetsko" <myetsko@insydesw.com>
Date: Wed, 12 Jun 2002 14:18:31 -0400

A while back someone posted a request for info on antennas for GPS.

I had found this one quite some time ago, and was going to build it,
but just haven't gotten around to it.

http://www.geocities.com/CapeCanaveral/3161/gps.htm

Anyone have any feedback on this thing? It looks pretty interesting.
Just gotta remember to insulate it or otherwise protect it since my
Garmins all put voltage on the antenna center pin.

I wonder, how bad would a cap in series right at the antenna feed
point detract from the optimum...

Mike

Rendered body type: text/plain

I suppose the real question is how you felt about it's preformance with
regard to the 'stock' Garmin antennas.

In my case, I'm not so concerned about putting the antenna 'outside' as

```
much as I am getting it out from under the roof.  Unless I place my
GPS unit way forward on the dash, I'm under a lot of the roof.  And
my dash isn't flat.  It's a PITA!  (A Dodge Intrepid)  But,right on top
of the steering wheel 'tilt box' is PERFECT for the thing.  It's in the
instrument cluster area, which means it's natural to glance at.  And it's
'lower' than the instruments so that it's not in the way.  It's in a
recession
in the terrain which means it doesn't slide around.  But I loose a lot of
sensitivity in that area.  I was just thinking of a 3 foot cable to put
the
'patch' antenna 'way out front' at the bottom of the windshield to run
the GPS down there.

Mike

524. [aprssig] Re: What's with EMERGENCY MESSAGES???

From: "Doug Younker" <dougy@ruraltel.net>
Date: Fri, 14 Jun 2002 15:25:03 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-85003-2002.06.14-16.37.25--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
How is a APRS emergency beacon, with its unknown emergency need, unlike a
911 hang-up call and where an on-duty law enforcement unit is sent to
investigate the call and need?  I assume if my station receives an emergency
packet the position would show on the display map with the resolution
possibly down to the street level depending on what maps I have available
and I as the reporting individual can relay this on to the dispatcher.  I
don't think the emergency beacon is as useless as many think it is no it's
not perfect but, the 911 system has it problems also even with, all the
money and time spent on it's development.--73

It is the Network 105 (keyboard to keyboard)
frequency around here.

Over in Europe it is an APRS frequency.

Subject: [aprssig] 14.105 use?

I monitored this freq. for an hour this afternoon to see what I could hear.
I
thought this was the 20 meter APRS freq. Here is the position list from that
hour. Is anyone sending position reports or just beacons here? What is this
all about?

526. [aprssig] Central TX APRS Congestion - Ideas?

From: Greg Jurrens <greg@jurrens.net>
Date: Fri, 14 Jun 2002 17:19:33 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-85011-2002.06.14-17.56.53--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
List:

Several of us iGATE and UIDIGI operators in Austin are looking for some insight into an APRS congestion
problem we are having in Central Texas.  This is not meant to inflame or start a war, yada-yada....We'd
like to find some real solutions.

Below is an excerpt from my Xastir iGate tnc.log file.  This represents around 2 minutes of incoming TNC
 data from noon today.  I chose NOT to edit the callsigns for techical accuracy...so PLEASE don't go off
 and FLAME these people.  It really looks like a group dynamics issue rather than 1 offender.  I'm
suspecting a high altitude WX station with too much WIDE being heard directly by 2 or more simple
digipeaters without UIDIGI code.

Here is the exec. summary:

Log time approx. < 2 mins.
Total Packets - 103
```

Cast: In order of appearance -
KB9WVG-14 - 1 packet 1%
W5VEX-1 WX station - 81 packets 79%
KA9KTH-9 - 11 packets 10%
W7KPW-1 - 1 packet 1%
N5ZTW - 3 packets 3%
W7KPW-5 - 2 packets 2%
W5OEM-15 - 5 packets 4%

My iGATE is 60 miles from the WX station and 57 and 80 miles from the 2 active digipeaters in this excerpt.

********* SORRY FOR THE LENGTH OF THIS! SUGGEST YOU DELETE IN REPLIES ********

Well, is it really necessary to run WIDE7-7 to get to an IGate? No one really needs to run any more hops than is necessary to get to an IGate. Most of the stations here in Southern California don't run anything bigger than WIDE2-2, because there are IGates all over the place within one or two hops. I would suggest you contact anyone running WIDE7-7 or something rediculous like that and ask them to try WIDE2-2 or WIDE3-3 and see if they can still hit an IGate. Remember, if you can hit an IGate, the world can see you. A station changing from WIDE7-7 to WIDE2-2 can eliminate hundreds of extraneous packets each time it transmits.

Yeh, that a problem, I try to catch them, but
not always.

I addressed this in a post the SIG has two names.

The TO and CC are the same so it gets sent to the SIG
twice.

Don't know who or why but everyone gets two copies.

PCSAT should have just come over but I didn't hear anything. I also do not see any new posits on the pcsat findu page except for the ones for it's own position. I hope I am set up correctly.

Radio set to 145.825 on low ground plane antenna
APRS + set to gate to Internet.

>Well, is it really necessary to run WIDE7-7 to get to an IGate? No one
>really needs to run any more hops than is necessary to get to an IGate.

It all depends on your goal. I personally prefer to think in RF terms such as if my packet is going to the local area or the region. Doesn't matter if the Igates see it or not. There's much more to APRS then just getting to the nearest IGATE. On the other hand, if that's what somebody is aiming for - great.

In this specific instance, there are very few instances where a WIDE7-7 is justified. Is there a regional group with regional suggestions on what the path should be? I bet it's not WIDE7-7.

The first step towards a congestion problem is just what was listed. Gather data and statistics. Look for data points that are out of the norm when compared to the others. Use education and, if necessary, technology to tune the network.

Bill, WA7NWP

> Well, is it really necessary to run WIDE7-7 to get to an IGate?

Please remember, not everyone is trying to hit an igate! Out here in Texas some people are only trying to be seen 200-400 miles away. They could care less about being seen in England or wherever.

Greg,

Here are a few thoughts...

W5VEX-1 - Why transmit a WIDE7-7 from the Temple/Belton area?? I would think that a 3-3 or even a 2-2 would get into Austin just fine.

W7KPW-1 - Given his location a 250W ERP station doesn't sound too unreasonable. That far west of Killeen (IIRC) is pretty empty. It would be interesting to know what the digi hardware and configuration is.

N5PAY-5/N5ZTW/K5BWD-10 - No position data, but we could get it from the stream. I don't see anything wrong here.

Any other thoughts....

THX/BDH

I have cut back on several occasions and then not been able to hit a findu gate... I will cut it back again and see what happens... We also have two wides in the area that ping pong me... My lonesome weather station and one wide (W5VEX & W7KPW) was all we had in Central Texas until Austin and San Antonio joined the game, mostly in the past year...

I travel extensively and findu is the way I check on my weather back home...
BTW, the weather station feeds a 5-watt MFJ data radio that feed a Ringo Ranger (6 db gain if I recall), the top tip is about 30 feet off the ground, which is 682 feet above MSL... Not a powerhouse by any means... I will change it shortly to 4-4 and see what happens...
Let me know...

Joe Dorn, W5VEX, Belton, Texas

List:

Several of us iGATE and UIDIGI operators in Austin are looking for some insight into an APRS congestion problem we are having in Central Texas. This is not meant to inflame or start a war, yada-yada....We'd like to find some real solutions.

Below is an excerpt from my Xastir iGate tnc.log file. This represents around 2 minutes of incoming TNC data from noon today. I chose NOT to edit the callsigns for techical accuracy...so PLEASE don't go off and FLAME these people. It really looks like a group dynamics issue rather than 1 offender. I'm suspecting a high altitude WX station with too much WIDE being heard directly by 2 or more simple digipeaters without UIDIGI code.

Here is the exec. summary:

Log time approx. < 2 mins.
Total Packets - 103

Cast: In order of appearance -
KB9WVG-14 - 1 packet 1%
W5VEX-1 WX station - 81 packets 79%
KA9KTH-9 - 11 packets 10%
W7KPW-1 - 1 packet 1%
N5ZTW - 3 packets 3%
W7KPW-5 - 2 packets 2%
W5OEM-15 - 5 packets 4%

My iGATE is 60 miles from the WX station and 57 and 80 miles from the 2 active digipeaters in this excerpt.

Belton Texas isn't Southern California or the East Coast... I was the lonesome APRS weather station for over two years in this area with NO activity in Austin or San Antonio... My packets had to go a hundred an fifty miles west and then back into the DFW area to make an I-gate...

Times have changed, and I will drop it down and see what happens... Stay tuned, city boys...(GRIN)

Well, is it really necessary to run WIDE7-7 to get to an IGate? No one really needs to run any more hops than is necessary to get to an IGate. Most of the stations here in Southern California don't run anything bigger than WIDE2-2, because there are IGates all over the place within one or two hops. I would suggest you contact anyone running WIDE7-7 or something rediculous like that and ask them to try WIDE2-2 or WIDE3-3 and see if they can still hit an IGate. Remember, if you can hit an IGate, the world can see you. A station changing from WIDE7-7 to WIDE2-2 can eliminate hundreds of extraneous packets each time it transmits.

How do stations appear on findu.com? When I run aprsd it connects to some other hub sites. I understand this is the IGate function. Will sites learned through the digipeater automatically be distributed and eventually appear on findu.com? What's required to have the actual digipeater appear on findu.com?

Sorry if this may seem trivial. But I have yet to find comprehensive information on APRS. I am pulling together a lot of bits and pieces from everywhere, but I have almost zero info on the IGate thing.

I have a Tripmate I am going to mod when I get the time.  I wasn't going to
use a power switch, I was just going to power it up by plugging it in.  Any
thoughts out there on this?

I am also thinking about putting the TinyTrak inside.  I've seen a few that
have done this on their sites.

If anyone is looking for VHF Mitrkes for a digi or other APRS use let me know. I've got a few that were pulled from commercial service. They are in good shape. Will make a good deal on them or consider trades. Let me know what you have.

On 6/11/02 5:58 PM, adi@adis.on.ca (Adi Linden) wrote:

>How do stations appear on findu.com?

Pure magic ;-)

Actually, findu connects to the APRS Internet System just as you do, and all the data that is received gets parsed by a Perl program and stored in a MySQL database (current size 20 GB, mostly data generated in the last 90 days), when you request the page a program called a cgi (common gateway interface) script written in Perl queries the database, builds the page, and the Apache web server sends it to you.

>When I run aprsd it connects to

As long as there is an IGate in range, yes.

>What's required to have the
>actual digipeater appear on findu.com?
>
Send a beacon out using the BTEXT function of the TNC, for an example see:

http://www.findu.com/cgi-bin/find.cgi?call=kd4bbm-6

>Sorry if this may seem trivial. But I have yet to find comprehensive
>information on APRS.

Have you looked at Stan's books on APRS, available from the ARRL? There are lots of good sites that cover various aspects, but the topic is so large it really does take a book even do a decent survey of what is out there.

>I am pulling together a lot of bits and pieces
>from everywhere, but I have almost zero info on the IGate thing.

There is some old but still viable technical stuff on vm.aprs.net, papers that describe the basic principles. There isn't much out there on the subject though, other than a few how-tos and such.

THIS IS MY "REPLY TO ALL" USING EUDORA. IT SEEMS TO WORK AS EXPECTED. I
CHECKED "REPLY" OF COURSE, BUT NO NEED TO COPY JOHN TWICE.

So what's missing in Eudora? The fact that both addresses are in the "To:"
list?

Tony

Rendered body type: text/plain

```
Ooops, I'd Better reply to the sig as well,

Ah yes, its performance against the stock antenna.
Well, I cant really remember how great the stock GPS45 antenna was, but I
know it was good. But like I said, this home-brew patch really suffers from
the lack of a preamp. Anything within the 45deg. field of view of the
antenna will severely attenuate sat signals. this can be a real pitb when
there arent many available sats in view, or the geometry is poor to begin
with.

The "poor sat. geometry" was the most common problem I had when using mine,
```

and it was in the clear on top of my old '67 chevy van. But remember, the 45 I had was the 8 channel sequential receiver, and I havent tried the beast with my newer 12 channel parallel III+. The terrain here can be quite hilly, this caused problems as well when driving on some freeway grades with a steep hill along one side, even though a good 2/3rds of the sky was visible. I used it a few times on the dash of my wife's pontiac grand am, another car with a rediculously swept windshield. The things that caused problems were; sky blockage from the roof to some extent, and windshield wipers that parked over the antenna when they were on intermittant operation. also, water on the window would affect signal strength, but water on the antenna itself didnt seem to affect it much. snow cover? forget it!

The antenna was certainly capable down to the horizon when it was in the clear, but when you're driving, clutter like trees, tall or nearby buildings, bridges, 45' semi-trailers in the next lane, foil hamburger wrappers tossed on the dash, etc. will prety much kill the low angle coverage, the lower sats wouldnt be that great to use for a fix anyways. Now you've got me thinking I should try it again with the III+ just to see what difference a better receiver makes.

overall, it wasnt as good as the stock helical antenna, but the helicals have an amp in them, even if it is just a transistor and no filtering. weigh this against your antenna placement options; stock(not the best when compared to an active patch) ant. in a poor location, or an OK antenna with a much better but less than perfect location.

It's kinda hard to describe the differences without Az./El. charts for each.

I suppose the real question is how you felt about it's preformance with regard to the 'stock' Garmin antennas.

In my case, I'm not so concerned about putting the antenna 'outside' as much as I am getting it out from under the roof. Unless I place my GPS unit way forward on the dash, I'm under a lot of the roof. And my dash isn't flat. It's a PITA! (A Dodge Intrepid) But,right on top of the steering wheel 'tilt box' is PERFECT for the thing. It's in the instrument cluster area, which means it's natural to glance at. And it's 'lower' than the instruments so that it's not in the way. It's in a recession
in the terrain which means it doesn't slide around. But I loose a lot of sensitivity in that area. I was just thinking of a 3 foot cable to put the
'patch' antenna 'way out front' at the bottom of the windshield to run the GPS down there.

Look at the timestamp in the message. It's something that got caught
in the queue somewhere and managed to get out.

If a network connection is bad, and a server is trying to forward mail,
it can get an ack or a nak, right? What happens if the 'bad connection'
kills the ack? The receiver will forward the 'correct' email it got. But
the sender will wait till later and finally resend it.

I've been told there are 'sequence' numbers to prevent this. But what
happens if the receiver has ALREADY forwarded the email LONG
before the sender gets around to a resend?

Mike

Kevin,

Looked good, and that's exactly what I wanted to build.

In your photo, it looked like you put a single magnetic disk on the thing.
I would suspect that the edges would act like wings to pry it loose at
speed in the car.  I would have used corner magnets and maybe even
put some kind of 'deflector' on the leading edge.

By the way, I didn't realize the Garmin antenna had a transistor in it.
At one point I tried to use a BNC extension cable with mine, and it
failed miserably.  I wonder if there was a cap in it?  If so, that would
make sense.

Mike

Hi Guys,
I thought I'd just let you know what's been happening on 6-meter BEACONet.25
(AX.25 on 53.530 MHz). Pretty cool stuff, overall.

Ev, W2EV

-------- Original Message --------
Subject: [BEACONet] 6m AX25 catches in KY - 06-14-2002
Date: Fri, 14 Jun 2002 21:17:48 -0700 (PDT)
From: Jeff Thomas - KD4EVB <kd4evb@yahoo.com>
Reply-To: BEACONet@yahoogroups.com
To: beaconet@yahoogroups.com

Lengthy 6m opening today, even reports of 2m e-skip in certain areas. Almost the entire northern tier states west of Michigan were coming in at one time or the other today, some openings to Florida noted. SD, ND, NE, IA, WI were coming in for many hours, shorter openings to other areas (probably open to more, just not much activity in them) such as WA, MT, MN.

Guess the gods of propagation decided to flip the switch for 6m stateside back on, six came back in a big way this week!

Logs from EM78pp: (all dates/times UTC)

```
06/14/2002  KG4RII    30 pkts  1612UTC  EL86tx  FL
06/14/2002  N8QLT      1 pkt   1553UTC  EN82hl  MI
06/15/2002  WA2GUG-15  3 pkts  0112UTC  FN30    NY  *
06/15/2002  N8QLT      1 pkt   0118UTC  EN82hl  MI
```

* Appears to be non-BeacoNet activity, good NY prop indicator anyways.

FWIW BG Micro (www.bgmicro.com) has Trimble SVeeSix-CM3 GPS units + active
antennas for 24.95. These are only 6 channel units, but at this price it
might still be worth it.

559. [aprssig] Thoughts on emergency beacons

From: "Alan Heaberlin" <amh@QNET.COM>
Date: Sat, 15 Jun 2002 08:12:27 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-85148-2002.06.15-10.47.44--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

After giving this topic some consideration I have come up with some
observations about EMERGENCY beacons on APRS.
Here is what Webster says:
emergency n.,(orig. sense, an emerging) a sudden, generally unexpected
occurance demanding immediate action.

Of course the definition doesn't say by whom the action is expected, only
that there should be some.
When I travel (generally off-road or something like that) with my tracker on
I generally tell someone (family, friends, other hams, etc) first where I'm
going, when I expect to get back and and how they can see me on findu or on
my home station's computer screen. This is good advice anytime you travel
where an emergency might emerge.
When I think of emergency, my minds eye sees a police car, fire truck or
ambulance running Code 3 and getting to the action.
Unless I'm upside-down in my 4WD truck and my last gasp of effort is to flip
the channel 2 switch on my Tiny TrackII, I'm probably not going to think of
sending an emergency message on APRS. I will be screaming into my cellphone,
on 2 meters, 440 and on CB (yeah right). If I really neeed help, I'm
lighting up the spare tire with a road flare or firing 3 shots into the air.
The point is that APRS has limited usefulness in a true emergency situation
anyway. Seeing an emergency for someone 2 or 3 hundred miles away does not
give you an opportunity to be of much assistance (OK ships at sea are an
exception). Mostly when we're looking at our screens we are simply
spectators. I'm not saying it doesn't help to be vigilant, just that the
chances of being in position to help anyone are slim.
On the other hand, when our Homeland Security forces want to try out our
little APRS play toy to see if there is some benefit to using it as part of
a complex and long term strategy, we jumped at the opportunity to be of
assistance.
Let's try to keep the whole thing in perspective and avoid picking the fly
specks out of the pepper.
If the Air Force Research Lab saw the BS running on this list about what
constitutes an emergency and all the other flap that's gone on for a couple
of weeks too long, they would cancel their APRS project on those grounds
alone!

It's not just that. Look at the headers below from Steve Dimse's June 11 'Re: findu.com' message that re-appeared last night - note that the SIG appears 3 times in To: and cc: (that may or may not be from Steve's email client - in a few previous messages I checked it appears either twice, once each in To: and cc: or 3 times, as below), and that the list address and software version lines are duplicated. These lines are single in a normal message and are added by the list server. Most of the delayed duplicate messages have these lines duplicated also. Something is definitely messing up with the list server.

John -

Thanks for the notice on the Trimble's. BG Micro lists these
Trimble units under their "late addition" section:
http://www.bgmicro.com/lmad.htm

Tom Clark's, W3IWI, TAC-2 board interfaces with the Trimble SK-8, but may
require additional work (components and docs) for the SVeeSix.

I believe Tom used some SVeeSix models for his early TAC-1 and TAC-2 work
(memory from the 1986 AMSAT conference).

Nice Motorola 8 channel Oncore models [VP, GT+ and a few UT] are now
appearing in surplus (cellular site upgrades). I picked up a very nice GT+
model for $ 31.00 on eBay for a tracking project just last week.

Do these units transmit data over 60,000 feet like the Oncores? I'm looking for unit for a balloon launch.

Don't know about the Garmin units. In another posting, you mentioned
flying to 120kft. Be advised that the COCOM export rules forbid the
export of GPS receivers capable of operating at altitudes greater than
60 kft while flying at speeds greater than Mach 2 -- and since
manufacturers don't know if their hardware might be exported, they
apply the rule to all their products. This export rule is
affectionately known as the "Anti-SCUD" rule.

One manufacturer (Trimble) chose to interpret the two parts
of this rule with a logical OR test. Whenever a Trimble SV-6
flies thru 60kft altitude, the receiver does a cold-start
reboot placing it in Sunnyvale, CA.

Another manufacturer (Motorola, with firmware revisions 5.0
and greater) wanted to be able to have their receivers used on
balloons, so they (and their lawyers) determined that the two
criteria were joined by a logical AND, the ONCORE (and the
predecessor PVT-6 receivers with post ~1994 Rev.5 firmware)
have a proven track record in balloons than fly slower than
Mach 2. It is reported that the Rockwell Jupiter (and hence
probably the original DeLorme Tripmates) uses the same Anti-
SCUD definition that Motorola did and it SHOULD be OK.

I wonder why the fixation on the GPS-2+? Given that it is built for
human use with an LCD that will surely freeze up, why not just
use one of the OEM board-level GPS receivers?

73, Tom W3IWI

Rendered body type: text/plain

Found this interesting. One of the people I work with was involved with catching Sea Turtles in Baja, Mexico so that they could attach transmitters. Guess these transmitters cost BIG BUCKs and they do not track very many. Some of the turtles
made it as far as Japan and the signal was lost. Army Corps of Eng. is also involve in turtle tracking. All sorts of info on the web.

Story...
The small, low wattage transmitters attached to the turtles are controlled by a micro-processor which is programmed by a computer before they were attached. The program tells the microprocessor how to store information and when to transmit the information to the satellites. There are 4 polar orbiting satellites that are currently used for tracking animals. The satellites are operated by the U.S. National Oceanic and Atmospheric Organization (NOAA) and are the same satellites used to monitor global weather patterns......
For the full story....
http://www.cccturtle.org/satintro.htm

Gee, what a great project for the PCSat guys!

Jim

***** Please reply direct *****

Stan has been a pretty good guy about my picking the brains of folks on this list with non APRS stuff, as long as the list isn't cluttered with responses. Thanks, Stan!

***** Please reply direct *****

- - - - -

I need to speak with someone who **knows** batteries. Not just someone who read something or has annecdotal data...someone who knows batteries. If this is you...I'd really appreciate your help (and you can rest assured that you've touched the lives of 15,000 students in a very positive way).

I need to know what type of battery is least suseptible to partial-discharge, partial-recharge 'damage'. I need the 'formula' (lead-acid, NiCd, etc.) not a brand name (Eveready, etc.).

The application is laptop computers that will be used by teachers and students throughout the day, and may be only partially discharged when they're hooked back up the the charger...or partially charged when they are removed from the charger to be used.

Insights are appreciated.

Ev Tupis, W2EV

Oh, by the way... **** Please reply direct ***** :o))

Very interesting!
Actually, this would make a great project. I am sure there are many
scientists who would love to do research like this but can not afford the
commercial equipment. What a great service to the scientific community
that
would be if a prototype could be developed! Hopefully, there are many more
APRS sats in the offing to support an effort like that!

Peace & 73

The Trimble receivers are supplied as small printed circuit cards with CMOS compatible TTL level input and output. For connection to
the computer, the I/O lines must be inverted and buffered to RS232 levels. A simple interface circuit shown below provides a
regulated power supply, backup power for the on-board memory and buffering for the main I/O lines. The 1 PPS timing signal is not
used here, so has not been buffered, but they do appear to be NMEA compliant.

Instead of

```
print out `date`;
```

use

```
$date = `date`;
chop $date;
print out $date;
```

Better yet, use perl functions to get the date.

The odd thing is that UI-VIEW has no problems with the fact that the date is out front...

I read somewhere that a prototype was developed for tracking crickets. It failed because the units were too heavy, and the crickets couldn't move very well. Their legs couldn't support the weight. In any case, Sea Turtles probably could handle the payload much better.

You can combine all of this into

```
print out "$date $_";
```

584. [aprssig] Trmble Svee-Six

From: Doug Bade <doug@clecom.com>
Date: Sun, 16 Jun 2002 09:42:56 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-85246-2002.06.16-09.21.12--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The Trimble Svee-Six CM3 CAN be NMEA but may not be.

There were 3 different flash upgrade-able versions, TAIP, TSIP, and NMEA. I have flashed them to NMEA but they may not be. I do have a Trimble Manual on the Svee-Six, if info is needed. It is paper (spiral bound about an inch and a half thick).

I was involved in the Pic-E conversion process, although N8XOS Greg did most of the code work along with John W2FS's assistance on re-compiling...

The GGA vs RMC info quoted was an issue as the NMEA sentences are only partially available... They are great units once you get them going. TAPR had an interface kit and may still, but a Max 232 based circuit is fairly simple... I built 6 stand alone trackers which we use for public service events, based on the Svee-Six. They glitched at Y2KRO but have been fine since.

I have a board interface,with radio and PIC-E layout based on a modem sized case BG MIcro used to and may still sell, which was done in Express PCB CAD form . I had them make some PC boards. Not real cheap but very professional. Some drilling of mounting and such needs to be done, but anyone interested contact me for info. The CAD program is free but you must use there service with the CAD files it makes...

Rendered body type: text/plain

I purchased a Trimble Svee-six CM3 quite some time ago and it worked perfectly with my Kenwood D700. I had to build a RS232 to TTL converter and run a program to configure the GPS to output NMEA data. I also had to build a regulator from 12 to 5 volts and put it in a little Radio Shack project box. It continues to work great.

Below is a sample output I captured on my unit during the process of testing it out a few years ago in case anybody wants to see what it can output in the NMEA format which consisted of $GPGGA and $GPVTG sentences:

```
$GPGGA,005415,3448.186,N,08641.806,W,1,6,001.5,282,M,-030,M,,*70
$GPVTG,000,T,001,M,00.0,N,00.0,K*4F
$GPGGA,005416,3448.186,N,08641.806,W,1,6,001.5,282,M,-030,M,,*73
$GPVTG,000,T,001,M,00.0,N,00.0,K*4F
$GPGGA,005417,3448.186,N,08641.806,W,1,6,001.5,282,M,-030,M,,*72
$GPVTG,000,T,001,M,00.0,N,00.0,K*4F
$GPGGA,005418,3448.186,N,08641.806,W,1,6,001.5,282,M,-030,M,,*7D
```

Can anyone tell me where the "mystical" SERIAL NUMBER is to register PM5???????

It's not on the CD
It's not on the CD case
It's not in the "Help About" screen

Software like this really tics me off!!!!!

Thanks in advance!

Mark,
You must register PMap via the web, or by phone in order to get a serial number. It is not included on the CD.

You need to either call them with your info, name email and so forth. Or
you register over the internet, and then you are issued the serial
number to fill in the space to complete the registration, fun huh?

First buy the software, then ask permission to use it, and hope they don't
go belly up before the next time windows eats your machine, and you have to
re-install.

Actually, I've been running XP pro since january, and it's been pretty good.
I can force it to crash by overclocking, but that's hardly fair play.
When not stressed beyond spec, it's pretty darned stable.
Though not as good as my RH6.2 box which went 18 months through all kinds
of install, rip out, re-install torture.

First....thanks to all that responded...

ok....traveler gives me a product code needed for Traveler but that doesn't
seem to work for PM Streets.

Are they different and if so where do you get the Product id for
Streets?   Boy, aint this fun!!!!!

Probably going to see alot more of that type of
registering that is based on what hardware is
installed.  Then it won't work if you change machines
or major hardware changes.

NOT GOING TO BE FUN.............

I never did figure out how to get the serial number for Streets, but it
seems to work OK without registering.  I registered Traveler.  Maybe
that's all you need to do.  Streets didn't accept the same number as
Traveler.

Rendered body type: text/plain

```
If you are encountering difficulty registering PMap, try the following.

The file Traveler.exe should be in your PMap50 directory if you did the
full install.

Run Traveler.exe.
```

If you are not registered, a "Register Today" screen will appear. Press the "Register over the Internet" button. A second screen will appear that states "Your product code is 1035-xxxx". Write down this number.

Now, you should goto http://www.registermyapp.com Click the link that says "Register My New Software Now". A new page will appear and ask for you to "Enter your unique product code below". After entering the product code written down earlier, press the "Register me" button.

Mark,

My traveler gives me a different product code. 1035.xxxx Each user MUST use the product code that appears on HIS computer.

The GEKFF is your unique S/N I think. IOW, your product code and serial number may not work with someone elses CD.

I think once you register Traveler, this also registers PMap streets.

Bill KC9XG

Rendered body type: text/plain

the power went out for 4 hours today, exceeding the run time of the UPS. As a result the database files have been corrupted. I am in the process of repairing them now, but it will take a few hours.

For now the www.findu.com domain is referring to the backup server in the Keys, but it is a slower machine and the DSL line is not too reliable. Also the timeout for www.findu.com had been set quite long, so it may be a while until your DNS cache updates. In the meantime, it is possible to use it directly as www3.findu.com.

I think all functions are operational on the backup server except for email reception of reports. Problem reports appreciated...

Steve, here at 2320 EST, I can't get any links to come up, even if I change the sub-domain to www3. I take it that's from the DNS update delay.

Jim,

Dieter, KX4Y, updated me on his problem. When he first called Alinco they said they were aware of the problem with the TNC losing its configuration and that was pretty much the way it was. There was no offer to fix his problem. Since my initial posting on the problem, Dieter went to Dayton and received a completely different response at the Alinco booth. They sent him a new TNC to replace the one in his DR135TP to see if it solves the problem.

This past week Dieter told me that it appeared to be working much better and did not seem to lose its memory. However, he did note that he had not really tested it very well or for very long since he was discouraged with Alinco's initial response. He replaced the radio with a Kenwood TMD-700. Hopefully, his problem is solved with the replacement TNC that Alinco sent to him, but he needs to do a little more testing to verify it has been resolved.

Tim - N8DEU
Huntsville, Alabama

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-85405-2002.06.17-10.53.54--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just pulled a multi call query

http://www.findu.com/cgi-bin/find.cgi?call=kd4rdb-14!Wes'%20Van,kd4rdb-12!Steph's%20Car

and it reported "sorry, call not found" because kd4rdb-12 had no report cached in findu at that time. It occurred to me that with a lanudry list of callsigns listed, if one failed, the whole query would fail. Wouldn't it be better to have findu display the calls it could find and let me the user figure out which ones were missing?

We have a new digi up at Healy on the Parks Hwy.   It is at nearly 3000ft putting out 50w.
The callsign is KL1SF-3. I am copying it here in Fairbanks.   We should have coverage from Denali or futher south thru the Fairbanks area when you travel from Anchorage to Fairbanks via the Parks Highway.   That is a beautiful drive that takes you right past the Park with awesome views of the mountain when the weather cooperates.
For those of you who might be driving that route, stop at the South Viewpoint for the best views.

There is a possibility that the new digi will be tied into the internet.

If memory serves me correct...

If the Gateway station has heard the station on HF that you are
sending a message to from VHF or IS, then the gateway station will
send that message to the HF port and to that station.  I do it all
the time with N5NGN in Georgia.

```
While playing with my gps 162 the other day, I was able to make the GPS turn on
by hooking up the data out pin.  The GPS was in garmin host mode (I had just
done a firmware upgrade to it) and was off.  It did have 12v hooked up.  I was
holding a circuit board which I was plugging the DATA OUT wire into a screw
lug.  I am unsure if the 60hz hum induced in my fingers on the metal screw
driver tip did it or what.  It was repeatable up until the time I changed the
mode of the serial port from garmin host to NMEA.

Has anyone been able to do this with other GPS units?  Is this just a garmin
host mode function or could we command a GPS on and off via the serial port?
It would be nice to power down a GPS to save power, then bring it back alive if
a car started to move.

Wes

> Beacon when you begin moving again if you have stopped more than a few
> seconds.

It'll also beacon rather a lot if you're traveling at/near the
low_speed value.  You need some hysteresis there.  Think of perhaps
a bicycle or a hiker traveling near 2 or 3 mph, with low_speed set
to 3 mph.

>  if speed < low_speed then
> ' ***********************************************************
>   if beacon_secs <> beacon_stop *60 then
>     secs_since_beacon=32766
>   end if
> ' **************************************************************
>   beacon_secs = beacon_stop * 60
>  else
> ' **************************************************************
>   if secs_since_beacon > turn_time and beacon_secs = beacon_stop *60 then
>     secs_since_beacon=32766
>   end if
> ' **************************************************************
>   if speed > high_speed then
>    beacon_secs = beacon_fast
>   else
>    beacon_secs = beacon_fast * high_speed / speed
>   endif
>
>   turn_threshold = (turn_min + turn_slope) / speed
>   dif = abs(old_heading - heading)
>   if dif > 180 then
>    dif=360-dif
>   endif
>   if dif > turn_threshold and secs_since_beacon > turn_time then
>    secs_since_beacon = 32766
>   endif
>  endif
```

Comparing the above to the HamHud sources shows that you're not computing turn_threshold the same way they are: HamHud sets turn_threshold = turn_min in the "else" clause, then if you're in the mid-speed range it adds a bit to it based on speed. Depending on what you have turn_slope set to, your version may work very differently from the HamHud version for corner-pegging.

I added SmartBeaconing to Xastir over the last few days. That made me look at your code and the HamHud code closely. I'd like to try your mods with a bit of hysteresis added as I think they'd be worthwhile.

Another possible mod:

```
// EXPERIMENTAL
/////////////////////////////////////////////////////////////////////
        // If we haven't beaconed for a bit (3 * sb_turn_time?), and
        // just completed a turn, check to see if our heading has
        // stabilized yet.  If so, beacon the latest heading.  We'll
        // have to save another variable which says whether the last
        // beacon was caused by corner-pegging.  The net effect is
        // that we'll get an extra posit coming out of a turn that
        // specifies our correct course and probably a more accurate
        // speed until the next posit.  This should make
        // dead-reckoning work even better.
```

I also computed the turn_threshold values that were used for different speeds in the HamHud. These values get much too big at low speeds, so I threw in an upper limit for turn_threshold of 80 degrees in my code. Perhaps 45 degrees might make more sense as an upper limit. I know that a computed threshold of 145 degrees doesn't make sense (to me).

I'm also thinking about making the turn_threshold more linear than HamHud, letting the user set a low and high value for turn_threshold and for speed. turn_threshold would then be computed by:

```
    deg_per_mile = (high_turn - low_turn) / (high_speed - low_speed);
    speed_increment = high_speed - current_speed;
    turn_threshold = low_turn + (deg_per_mile * speed_increment);
```

Example:

```
  high_turn = 45
  low_turn = 20
  high_speed = 60 mph
  low_speed = 2 mph
  current_speed = 42

  deg_per_mile = (45 - 20) / (60 - 2) = 0.431
  speed_increment = 60 - 42 = 18
  turn_threshold = 20 + (0.431 * 18) = ~28 degrees
```

```
At high_speed the turn_threshold would be low_turn or 20 degrees.
At low_speed the turn_threshold would be high_turn or 45 degrees.

Above high_speed we would use the low_turn figure just like HamHud.
Below low_speed we wouldn't do corner-pegging at all, again just
like HamHud.

Thoughts on any of this appreciated.

A Handspring Prism is what I use.  It runs Palm OS and also runs PocketAPRS
VERY well.  The other kick is the spring board expansion slot.  There is
now a TNC made by ShineMicro that is specifically supported by PocketAPRS.
The serial port is actually TTL for USB hotsyncing, but this can be
overcame easily with a simple converting cable.  I designed one using a
Maxim MAX-203 chip and it works great.  Take a look on my site at
http://www.ke4nyv.com.  Some don't like these, but I love mine.  I have two
Handsprings and both are great.  The Prism also has a color screen, so it
makes APRS much more easier to deal with (with smaller icons and such).

The handspring needs this. The palm units (IIIc etc) do not.

I use the IIIc because of the color. Memory is a bit marginal, a 16M unit
would be more comfortable.
```

```
As far as PSK, not without external hardware.
You'll need something like a pocket pc to go there, and only if it's sound
is sufficiently windows or soundblaster like to work.  Much more $ too.

Pocket PCs (HP Jornada, Compaq Ipaq, etc)  run a system (Windows CE - Compact
Edition) that LOOKS more or less like Windows but the processors are
completely different.  The hardware architecture is completely different from
standard Intel/AMD PCs.   In fact TWO different CPU families that require
different versions of programs are in use; neither of which will run standard
Windows apps.

Even standard PC file formats such as Word .DOC, audio .WAV etc aren't the
same! They have to be converted on the fly as the syncing utilities move
these files to/from the Pocket PC.  Any sound card-type app would have to be
written from the ground up from scratch for the pocket PC.  Not to mention
that there doesn't seem to be any kind of external audio INPUT on the Pocket
PCs I have played with.  (They do have a built-in mic for recording voice
memos to RAM).   They play back WAV or MP3 files to stereo headsets which
would indicate some sort of  soundcard-like A--D/D-->A converter is in the
units

I have run APRS/CE on my HP Jornada 520 (A color Pocket PC) connected to a
Kenwood TH-D7 quite nicely but that was going into the serial port -- not the
sound card.

Rendered body type: text/plain

I'm in Cincinnati and have my station set up to gate local traffic to the internet. I have a friend in St. Louis that I just got onto APRS but he is not connected to the internet all the time. I would like to be able to send him messages via APRS by having my station send the message to a gate in St. Louis, then have the St. Louis Gate RF it to his station. Then he in return would like to send me a message via the reverse path. In other words he wants to reply via the gate in St. Louis and have it send the message to me via the internet. I have tried different methods and paths but cannot seem to get it to work. Is it possible? How do I do it if it is possible? I have UI-View and the St. Louis friend has WinAPRS 2.5.1.

Thanks,

Duffy

Do any other areas have the problam of hams sendin'
bulletins over and over and over and over..... to the point you
wanna reach through the CRT and strangle them?

A bulletin only needs to be sent once or twice (maybe).

Sendin' it multiple times is a waste and tees others off, you have to get up
and
do an ALT E everytime the screen refreshes.

Let's promote send it once and KILL IT!

***

If your friend is being read as 'local' to the IGate in St. Louis, any
messages directed at him should fly. The St. Louis Igate needs to know he
is there. That happens when a valid position report is sent by your friend,
otherwise St. Louis has no idea he exsists. Once Igates 'learn' who are
local RF to them, they generally will gate messages. Since the messages are
being gated over the internet, you both need to make sure they are getting
to the internet, and not just RF. One of the keys for an Igate to process
the gating of messages, are valid position reports.

There are many ways to determine if a station is being heard on the
internet. The easiest is findu.com. That's the simple test <g>. From there,
is St. Louis set up to rebroadcast to its locals via RF? It takes time for
an RF station to become known to an Igate. Especially if the target station
is sending position reports every 30 mins. <g>. In WinAPRS you can force a
position report to RF and TCPIP by hitting the F2 key. Good Luck.

Wait a minute... I'm having trouble seeing for all the flashlight bulbs
going off
in my head.

Clearly the Visor with the new Shine Micro TNC/soundcard is a powerful
enough
soundcard to run a full fledged TNC, so why not write a program for it
so that it
could run PSK-31 as well.

Probably because the market for it would be so miniscule...... Aside from the "coolness factor" of being able to do it at all, I don't think it would be terribly practical.

1) APRS/packet is run on VHF with handheld portable radios.. For the most part PSK31 is an HF mode. What point would there be in having a miniaturized terminal when you are going to connect to full-sized radios and relatively large antennas.

2) Overwhelmingly, APRS is a broadcast-like RECEIVING activity -- you watch various kinds of data come in and be displayed. The amount of time spent composing and sending information is very small. By contrast, PSK31 is a much more interactive mode that requires the user to constantly originate volumes of text.

I don't think many people are going to want to carry on extended QSOs pecking on the hideously-undersized almost-unusable keyboards and displays of PDAs.
My feeling is that this falls into the same
technically-feasable-but-why-bother category as web surfing on cell phones.

1) APRS/packet is run on VHF with handheld portable radios.. For the most part PSK31 is an HF mode. What point would there be in having a miniaturized
terminal when you are going to connect to full-sized radios and relatively large antennas

Not exactly! I half hope that there is a PDA that WILL run PSK31 or someother digital mode. My "portable" station is a ft-817 that is carried inside a WorldPack II, attached to a GI surplus ALICE frame, with a west coast style mirror mount on the frame, and a GI surplus AS1887 whip antenna. My HF station is 100% portable and operable while moving... I did have problems at the Hamvention, I had to lower the antenna while inside the building... every room was too low, except for the main arena.

Right now, my laptop is bigger then my HF station.

With the low power required for PSK31, the current crop of small radios, such as the FT-817, are naturals. It would be way cool not require a "Mack truck" to lug the HF digital station around, the computer being a substantial component. (The same could be said for conventional mobile APRS!)

One potential advantage to the Shine Micro TNC is that it keeps the serial port free on the PDA. I assume (and you know what they say about assume and I speak from a position of no knowledge) that an external keyboard will still work with the TNC activated.

I'd be a customer

Chuck, KE4OAR

What is nice with the Shine TNC, now you can use the springboard to take care of that and still have a port open for GPS data, or perhaps a fold-out keyboard. Also, thankx to Dave V. for clearing up the difference between the Visor and Palm units. I have 2 Visors and a Palm IIIe. I use BOTH for packet and APRS. I have yet to play with PSK 31 on a palm. If you go to www.shinemicro.com you can see the lastest programs that have been written to support the new TNC. Mike Musick also released the new version of PAPRS at Dayton that supports the TNC as well. Really a great way to do things. I personally think the Prism has a much nicer screen than the IIIc (Palm color).

Just my personal opinion,
Jason KE4NYV

Before we fly off the handle and think that N7AAC-7 was doing something
wrong. Could it be possible that an mis-configured IGate was stuck in a
loop?

!T 14:35:49
!N7AAC-7>3S2VWS,KJ7KY,KJ7KY-15*,WIDE3-2,WA6OFT,I:''@Vl!^k/]"9k}

!T 14:36:46
!N7AAC-7>3S2VWS,KJ7KY,KJ7KY-15*,WIDE3-2,WA6OFT,I:''@Vl!^k/]"9k}

The looping occured over 150 miles away from his location in Phoenix.

Dick, KB7ZVA

Naw!  Well maybe...but not 150 miles!  He was heard direct RF in Phoenix.
Two or three blocks away!  And, no one accused him of doing anything wrong
in the original post or flying off the handle. However, the packet below is
from your Igate where this packet entered the IS, if I am not mistaken, as
you are the first Igate that sees Black.  Only one showing up in your neck
of the woods that morning.  My Igate would not convert the Mic-E packet and
would append my call on the end as they entered the IS...re: the packets I
posted originally from my log later in the morning.  In any case, seperate
issue but an interesting one at that!
N7AAC was found and contacted.  Thank you anyway!

 !N7AAC-7>APK101,KJ7KY,BLACK*,WIDE3-1:@161435z3326.71N/11136.56Wk16
> 6/000/Mic-E/M5/Special>

I think the following came from a Las Vegas Igate...
!T 14:38:52
!N7AAC-7>APK101,KJ7KY,WA7RAT-12,WIDE3*:@160049z3326.71N/11136.56Wk166/000/Mi
c-E/M5/Special>

And this one is really interesting!  Possibly what you are talking about!
That looks like some sort of loop, not sure.
!T 14:33:43
!N7AAC-7>APK101,KJ7KY,N7AAC-7*,WIDE3-1:@161433z3326.71N/11136.56Wk166/000/Mi
c-E/M5/Special>
```

I am pretty sure these are all WinAPRS Igates!

It is interesting to study the logs with another point of view. Appears KJ7KY is the key to figuring the what happen to the network as a whole! Am I reading this right? KJ7KY talks to Rat-12 direct??? Or direct to Black????

This packet...!T 14:33:36 !N7AAC-7>3S2VWS,RELAY,WIDE,WIDE3-3:''@Vl!^k/]"9k} appears to be original. No where in my log after this packet did I send this packet to the IS. I am pretty sure this packet was picked up by an igate 2 or 3 blocks away from Clark. However, I did send this one quite a few seconds (actually minutes) afterwards...

```
!T 14:35:49 !N7AAC-7>3S2VWS,KJ7KY,KJ7KY-15*,WIDE3-2,WA6OFT,I:''@Vl!^k/]"9k}
```

it's actually a 'different' packet!
Because I can append my call to the packet, I can tell what I send to the IS. A real handi feature of UI-View among other nice features like not sending a bazillon converted mic-e packets to the IS.
So now that I have totally confused myself <G> I think that if a loop existed, it was in the Phoenix Valley within 25 miles and the outer digi's and Igates were getting hit with the brunt of it....well into Lost Wages, California, etc. I do not agree that a loop existed outside the phoenix area with any igates. And to insure I was not part of it, I went as far as shutting my igate down and continued to log (from the IS (ALogger is a really neat tool, huh!)) the going's on. So where was this 150 mile loop you see?

Rendered body type: text/plain

Am I correct in my interpretation of these settings in APRS+?

ConvertMicePackets=1

Conversion of MIC-E is on and should be off?

TypeReject=}

Third party packets are rejected?

Is this good and what are the ramifications allowing them?

Interesting article, and a neat application bundle. But for those that didn't read the article, I just want to point out the potential for a new Darwin award candidate:

"In a well-publicized scandal back in 1998, a German couple drove their BMW into a river because their GPS indicated that a bridge crossed it -- when in fact there was a ferry."

Mike

I'll try to be serious, cause I wanted to say, 'huh'?

During that time period when you stated seeing 3000 packets from the station in question. I merely suggested a loop. Few of those packets actually made it down this way. What's interesting is that BLACK and KJ7KY-15 saw them as already converted. BLACK never saw the raw packets. They were converted and sent back to RF as new packets. Where they got converted and sent back to RF, isn't that great a mystery. The packets speak for themselves :)

This 'looping' is not new. We used to see it a lot as we were being adventureous souls by testing new server programs :) I haven't checked lately, but I don't think there is much loading happening at the core servers anymore. I'll be nice and leave it at that.

Cool

If the FAA follows form, if acccepted, this system will have plenty of safeguards to keep the planes and stationary objects from meeting themselves unexpectedly. But it looks like it could improve upon the visual representation for pilots during periods of poor or no visability.

Of course, that won't (and doesn't with current instrument flight and landing systems) keep the bold pilot from blazing his own trails and all too

frequently plowing new furrows on mountain sides and in the fields short of
the runways..

As they say, there are bold pilots and there are old pilots, but there are
no old, bold piolts.

I stated I received a report of 3000 packets.

I merely suggested a loop. Few of those packets
> actually made it down this way.

You suggested a loop 150 miles away and posted a packet with my call in it,
which obviously pointed to me which was way off the mark!

>What's interesting is that BLACK and
> KJ7KY-15 saw them as already converted.

Yes, exactly! We watched the same thing here....and it pointed back to KY's
station I think there were so many bouncing around, there must have been
many collisions in the Valley on RF.

```
BLACK never saw the raw packets.

It was certainly within the path that was set by the transmitting station!
It would have not been logged on the IS do to the fact it had already gone
by and would have been rejected.  That is what happened here.

> They were converted and sent back to RF as new packets. Where they got

```
Hello all,
   I mentioned to an ARES member that it would be nice to have some trackers
so that they could be attached to vehicles that we wanted to track and free
up a ham. We are currently supporting the Hayman fire. About 70% of the net
time is finding out the current location of this person or this vehicle.
   His question is this legal? How is the best way to respond to him on
this?

Thanks & 73,
Dave N0EOP

You can't.

Giving a transmitter to an unlicensed person is illegal unless you maintain direct supervision and can satisfy the requirements of the control operator responsibilities. This generally means being physically present to control the equipment. There are 3-rd party traffic considerations as well. But it's done all the time, and few people on this list will even bother to discuss it in a rational manner. And BTW - Mr Hollingsworth of the FCC has publicly stated it's illegal too. Just ask the folks running the NYC Marathon.

Ray stated, in part

>BTW - Mr Hollingsworth of the FCC has publicly stated it's illegal
> too. Just ask the folks running the NYC Marathon.
>
Do you have a source for this coming from Hollingsworth?

The way I heard the story on the NYC Marathon, that opinion came from a ham on the Marathon staff that was a FORMER FCC official, and may or may not have had a clear picture of waht APRS is, or a feel for the current state of the art. This was at least 3rd party and so may be an inaccurate picture of the situation.

I have not seen anything explicitly on this one way or the other from the FCC, just a lot of individual interpretations of Part 97.

I'm not saying you're wrong, I just hadn't heard that it came directly from Hollingsworth prior to this.   I think that on an issue with this potential impact on the use of APRS for Public Service and ARES work, we need a direct statement from an authroitative source.

In the meantime, dumb trackers can still be useful by putting them in vehicles with Hams on board that may not have APRS savvy to provide locational data to net control and satsifying legal requriements (as well as providing voice back up). This doesn't help in the original situation, but is something to take into consideration for future planning.

(1).....
.
.
(7) Transmissions of Telemetry

Definitions being at the beginning of Part 97 and definition of Telemetry (45) being: A one-way transmission of measurements at a distance from the measuring instrument.

So, as I understand it, measuring position via GPS is telemetry... and APRS is just fine if you are using a GPS....

But I could be wrong...

If you did same with 10 hams, whose batteries have discharged, are you not
in the same situation? If the tracker drivers stop for chow, is it not the
same situation?

Given the number of successful MS150 tracking operations, and other such
experience, I'd say it's not much of a worry. Analyze the risk potential
posed by the transmitters against the help the track provides.

Had I the 10 trackers, I'd do it. Sometimes, paranoia surfaces
unnecessarily. I doubt the FCC is worried about the assistance ham radio
provides in disaster events. Seems part of the 'service' we should provide
to me. Naturally, I wouldn't bother trying to convince anyone of anything.

Hi,

I have an Earthmate GPS unit and am wondering if it can be used for APRS
mobile operations to provide the necessary data.

THanks
Bob

This is one of those questions that qualify along the lines of "If you may
not
like the answer, don't ask the question"

The problem is that this 'scenario' is close enough to other scenarios
that

in the past have been 'frowned upon' by the FCC. Thing is, who is the control operator? Is he in control? Is he responsible? Is he capable of 'shutting the device down' if something goes wrong.

Now, handing a tracker some would argue DEFINITELY falls into the category of handing an unlicensed individual a radio, even if they DON'T press a PTT.

However, if you, as a HAM were to 'install' a tracker' in a vehicle that had no way anyone could tamper with, that you could drive out to shut off in a reasonable amount of time if it started barfing on the air, and YOU were willing to to declare responsibility for it... This scenario COULD be argued that it was no different than you putting a tracker in 10 balloons and launching them. Is that legal? Is one legal? Ok, what's the number?

Thing is, sometimes you don't WANT to ask the question. BUT!! Remember the guidlines. Try to keep it 'as if' it were a tracker in a balloon. That is, NO ONE can touch the units but the HAM control operator. NO ONE can INTERFACE with the units, but the HAM control operator. And just in case, the HAM has to be able to reasonably get to the units to shut them off in case of failure. That can be physically, or through a 'control channel' that is above 222MHz in frequency.

As long as nothing went wrong....

Thing is, it's up to the HAM who is the control operator if he wants to risk it.

Mike

One way to convince the FCC that you are in control is they you KNOW where every device is located at any given time, and you can control each one - even if you need to drive to it and turn it off. That is better control then most repeaters use.

Unlike the earlier Delorme Tripmate, the Earthmate outputs a proprietary
binary format that only works with Delorme programs (Street Atlas, TopoUSA,
TopoQuads, etc).  It DOES NOT output the standard NMEA ASCII required by
nearly all other GPS-using programs (rare exception -- UI-View supports the
Earthmate's binary format directly!).

However the GST-1 (GPS Sentence Translator) by Byonics (of TinyTrak fame)
will convert the Earthmate's proprietary format to standard NMEA 4800-8-N-1.

This PIC-microcontroller-based device is packaged in a male-to-female "gender
non-changer" that inserts between the Earthmate's DB9 female plug and the DB9
male plug on the PC or other device you are connecting to.  If you are
powering the Earthmate from external power with one of Delorme's forked
cables, the GST-1 draws it's power from the same connection.  Available from :
    http://www.byonics.com

for about $50  assembled.

Note that while the main GPS sentences are produced by this device, the
secondary sentences such as satellite status (GSV) are not.  This means any
sky view diagrams, DOP (dilution of precision) graphs, lists of satellites in
view, etc in your application will remain blank.

```
But for automated control, it says you must be able to affect control
"immediately upon being notified".  If the tracker is hundreds or
thousands of miles away, how can "immediate" be accomplished?  I know,
judgment call.

Not natively. The Earthmate outputs a critter known as Rockwell Binary
format, and has to be converted to NMEA compatible data before any TNC's
can understand it. If my memory serves me right, the little widget that
does that conversion costs between $30-$50, probably worth as much as
the Earthmate! Offhand I can't recall where those widgets come from...

Rendered body type: text/plain

I have my friends laptop over here, trying to get WinAPRS 2.5.0 to work with PM 3.0. Running the pmapocx,bat batch file, all files seem to copy OK, but REGSVR32 gives me an error:

```
        LoadLibrary ("MAPOCX.OCX") failed.
        GetLastError returns 0x00000002.
```

Any ideas how to fix this? The laptop is running W95, BTW.

Tnx es 7 3

Hi All,

OT...

For those of you who were active when "regular" packet was a extremely popular, you might have noticed some of the Field Day bulletins sent @ALLUS flaoting around before the big event in regards to "Proposed Field Day Bonus Points" and "How to configure your TNC for Field Day operation." The first was humor, the second was reference.

Might anyone have saved these old bulletins? I'd sure like to check them out, as I used to post them on my PBBS during each Field Day season for the fun of it, but have since deleted the files by accident a while back.

It would be great if someone can forward me these messages!

First I want to thank everyone that has responded. So far I've gotten several "that is illegal", several "legal providing that control isn't given to non hams", and some not sure but that they would do it. First if I was to install a tracker on a vehicle without a ham then I would seal the unit so that it would keep the honest person from being able to control it. Also for those that commented about gps..Yes they would have a GPS unit attached.

I guess that if we say that they are not legal than you would not be able to include one in an unmanned balloon flight. What about the number of gateways, digi's, and individual stations that are left operating when the ham is either gone or asleep?

My take is that if the control operator is identified and is the one that configured the tracker, installed it, applied the power to activate the tracker, and can reasonably be able to control (shut he unit down) if needed then it is OK. If non licensed hams have access to change frequencies or otherwise control the tracker then I would say no way.

Thanks to all of those that are providing responses,
Dave N0EOP

Weather permitting the Fayette County Repeater Association and Fayette County ARES will have a APRS demo (yes, we will be making contacts during Field Day as well ;-) for Field Day. In addition to having a base station setup for viewing, we will have a hot air ballon launch from our site. We will have a tracker aboard but I am not sure which callsign we will be using. Not sure which ham will be going along. The flight should be about 1.5 hours. The balloon will take off just south of the metro Atlanta. (one block from the home station of KD4YDC)
73,
Robert

657. [aprssig] Precission Maps 5.0

From: "John Scott" <n0hzn@charter.net>
Date: Thu, 20 Jun 2002 7:42:33
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-85894-2002.06.20-08.19.46--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Okay, I finally got it registered but when I use it in Winaprs 2.6.1 the
map only fills half the window which makes for a small map. Can anyone tell
me how to get it to open to the full window? And yes I have the map in full
screen mode. Thanks in advance.

John - N0HZN

```
Here is a suggestion, we have treid it before and someone broke it but I think
we can do this.

1.)     Do not use FieldDay as your call.  Use something like DCARAFD or your
regular call.  If you use a tactical call, remember to have the btext send a
legal call every ten minutes.
2.)     Igates need to had FieldDay in the list to gate to rf.
3.)     When you send a message to locate stations, send it to FieldDay.  This
will go out the gates and have the gates unprotopath.

This method will keep you from having to guess the call of the stations you
try to contact.

How does this idea sound to everyone?

Rendered body type: text/plain

```
Earl,
  The error you described may be encountered when Regsvr32 cannot find the file passed as an argument.

The command RegSvr32 MapOCX.OCX  will successfully register the OCX if the OCX is in the \Windows
directory.

The command line RegSvr32 C:\WinAPRS will register an OCX found in the WinAprs directory on drive C:

If the OCX is in a directory whose name contains a space, try enclosing the path in double quotes :
RegSvr32 "C:\My WinAprs\MapOCX.OCX"

John,
  Apparently, WinAPRS 2.6.1 will only allow a square map window (Width =
Height).  AFAIK, there is no way to force WinAprs 2.6.1 to create a
rectangular window that would fill the available display area.

Because you can log into them remotely and shut them off if needed.  The
person with the tracker (unlicensed or not) has no control of the PTT or RTL
(Release To Listen) button.  Then cannot cause the transmitter to activate
(one of the points in pt 97 about unlicensed people TXing), and you have can
remotely shut down or turn on the transmitter (another part of 97.).  Just
for snorts and grins, the second tracker I made with a tripmate in an ammo
box had a key switch from radio shack on it.

I see no problem with my wife carrying my "kd4rdb-12" digipeater around in
her car.

Wes

Hi John,

Until Mark or Keith release the next version that is all you
will get. The 2.6.1 version HAS to have a square map! So if
your screen is 10 inches tall, then you will have a ten inch
wide window for the time being.

What I do is have two windows running. Adjust the second
window to fill the blank portion of your screen.. Looks a
lot better!

Robbie, wa9inf

Rendered body type: text/plain

By connecting to port 1314, you have the ability to see a bidirectional
datastream for full worldwide messaging ONLY, without a history dump. All
station to station messages from all data sources and corresponding
position reports are available on this port.

Most APRS IS servers have this port available and it can be very useful
during special events, or in situations where you may have limited ISP
bandwidth issues. 3rd party station to station messages are supported from
all sources, ie. RF Messaging.

To find out more about the many different ports available for your Igate or
internet connection, visit http://kb7zva.com

APRS IS servers provide MANY different flavors of ports, not just regional
or full feeds.

(This was in response to an inquiry I received from a new user, that had
less than a 28k dialup connection, and kept being dumped by the servers
because he couldn't keep up with the full data flow :)

Good Luck,

Dick, KB7ZVA
APRSWest.net (10152 Full APRS IS Feed)
APRSWest.net (1314 Message ONLY)
APRSWest.net (14579 Western States, Full Feed)

Hi Jim,

Usually happens if your CDrom drive letter is not correct.
On the right hand side, fifth button up, Precision Mapping
open, set your States folder drive.

That's assuming you had no errors running the .bat

Good luck

Robbie, wa9inf

I wouldn't turn 10 of my friends from the bar loose with trackers with my
call sign on them. I think the broader implication Dave makes is with an
official activation.
If I'm the radio officer of an ACS or RACES unit and I'm activated by the
emergency coordinator then I feel that my use of Amateur radio strictly
falls outside of Part 97 for the purpose of the emergency. I wouldn't have a
problem putting my callsign on a tracker for each emergency vehicle in my
city but I probably wouldn't put on on the local pizza delivery guys car to
see when my pie is gonna get here!
Alan Heaberlin W6AMH
Radio Officer
California City ACS

```
Jim,
  The problem you have described may be encountered when some of the
mapping files are not available to WinAPRS and the PMap OCX.  The
\PMap50\States directory contains the files needed to draw street level
detail.

WinAprs expects that the 5.0 mapping data will be found in the \PMap50
directory.  WinAPRS only allows you to select the drive where this
directory is located.  A typical setup is to access the PMap 5.0 files on
your CD ROM drive on drive D:.  You must supply the correct drive letter to
WinAPRS by selecting the 8th button from the top of the toolbar displayed
on the right side of your display.

You can also place all of the PMap data on your hard drive.  This will
speed up the rendering of maps considerably.  You can copy directories
\Data1, \Data2, \Data3 and \States to a \PMap50 directory on your hard
drive (requires about 600MB).  Change your WinAprs CD Rom Drive setting to
your hard drive after you do this.  You could also copy just the \Data1,
\Data3, and a portion of the \States directory to your hard drive to
conserve disk space.  The PMap Help file contains information that lists
the state names and associated file names.
```

But a more carefull reading of the rules indicates you need to have the
control
on a frequency above the 2 meter band. Currently all remotely controlled
TNC's are remotely controlled via the radio they normally pass traffic
on. i.e.
two meters.

As a result, your argument is incorrect. You are not meeting the rules.
 Your

proposed operation is a violation of the rules.

Jim

Actually, the rules do NOT say that.

The rules say you must have a method for control.

IF you have and rely on a 'control channel', and IF that control channel is on amateur frequencies, it must be above 222Mhz. It does NOT say you CANNOT have control on the same or other frequencies. It does NOT say you must have a control channel.

He would only be in violation of the rules IF he relied on that same frequency for data as control, that frequency being below 222, and that

that frequency was the only method for control. It could always be
argued that it was NOT an unattended operation at that he could
designate another ham or personally terminate the operation. But
doing that, NO control channel would be needed. There is no rule
that specifies how close a control operator has to be to the device,
not how fast a control operator has to respond.

That interpretation would make every 2 meter (or lower) digi in a remote
location illegal on every packet freq. I do not beleive this to be the case..
My recollection of that particular rule is relative to voice repeaters, not
packet stations.

OK, it is my interpretation that the control station for an APRS tracker would be considered an Auxiliary station. This is because it is a remote control station.

Per 97.201(b): An auxiliary station may transmit only on the 1.25m and shorter wavelength bands, except the 219-220 MHz, 222.0 - 222.15 MHz, 431-433 MHz and 435-438 MHz.

No, the definition of an auxiliarly station is OTHER than a message
forwarding system (digi, node, PBBS). The control station also is not
meeting the definition as it is not operating in cooperation with other
stations for the purposes of message relay using point-to-point links.

How about "present at the control point"?

I gather that means within an arm length or two.

Which could be at the transmitter, at the end of a wire line
control circuit and/or the control transmitter (above 222 MHz
as has been pointed out).

Actually, the rules do NOT say that.

The rules say you must have a method for control.

IF you have and rely on a 'control channel', and IF that control channel
is on amateur frequencies, it must be above 222Mhz. It does NOT say
you CANNOT have control on the same or other frequencies. It does
NOT say you must have a control channel.

He would only be in violation of the rules IF he relied on that same
frequency for data as control, that frequency being below 222, and that
that frequency was the only method for control. It could always be
argued that it was NOT an unattended operation at that he could
designate another ham or personally terminate the operation. But
doing that, NO control channel would be needed. There is no rule
that specifies how close a control operator has to be to the device,
not how fast a control operator has to respond.

Auxiliary stations...
Remote control (or "telecommand") of a station, where a radio link
transmits DTMF tones, for example, to another station to change its
operating parameters, turn it on or off, change frequencies or power
or rotate antennas. These are considered to be "primary" controls
available only to designated control operator(s).

Ummm... There are auxiliary station in amateur radio... That is how
you control a repeater, bring in the voices from remote receivers,
utilize remote bases... all auxiliary stations.

Eric

OK, it is my interpretation that the control station for an APRS tracker would be considered an Auxiliary station. This is because it is a remote control station.

Per 97.201(b): An auxiliary station may transmit only on the 1.25m and shorter wavelength bands, except the 219-220 MHz, 222.0 - 222.15 MHz, 431-433 MHz and 435-438 MHz.

That interpretation would make every 2 meter (or lower) digi in a
remote
location illegal on every packet freq. I do not beleive this to be
the case..
My recollection of that particular rule is relative to voice
repeaters, not
packet stations.

If a ham is on the vehicle and they don't want to call him all the time, then throw an APRS tracker on the vehicle. If you are concerned about controlling the radio, then educate that ham on how to turn the radio on and off. There shouldn't be any problem.

Well, Eric, that's where you get in trouble takin' someones
interpretation for the rule, instead readin' the rule itself.

Part 97.3 Definitions.
(a) The definitions of terms used in Part 97 are:
....
(7) Auxiliary station. An amatuer station, other than in a
message forwarding system, that is transmitting communications
point-to-point within a system of cooperating amateur stations.

Auxiliary stations...
Remote control (or "telecommand") of a station, where a radio link
transmits DTMF tones, for example, to another station to change its
operating parameters, turn it on or off, change frequencies or power
or rotate antennas. These are considered to be "primary" controls
available only to designated control operator(s).

Subject: RE: [aprssig] Re: Question about trackers?

No, the definition of an auxiliarly station is OTHER than a message
forwarding system (digi, node, PBBS). The control station also is
not
meeting the definition as it is not operating in cooperation with
other
stations for the purposes of message relay using point-to-point
links.

As part of my schooling and continuing education, I have had to take a few law courses. Two of the few things I remember that seem appropriate here are:

1. there are no laws only interpretations of laws
2. unenforced law is no law

Toward item one, we could read part 97 for weeks on end (and it seems some here have) and debate what it *really* means but that isn't going to get us anywhere. The words aren't nearly as meaningfully as how they have been interpreted by the FCC not your friendly neighborhood lid.

And that is a good segue into item two. I can't find a single instance of the FCC sending a single enforcement letter related to APRS.
Obviously, the FCC knows that trackers are in balloons. Obviously the FCC knows that a plane without a license ham carried a tracker across the country. Obviously the FCC knows that some cars/vans in some public service events driven by non-hams are carrying trackers.
Obvious, why? Because in every one of the above cases a concerned ham (and probably a few dozen lids; the two are not always synonymous) has contacted the FCC to report the event. Besides that, many if not all these have been written up on ARRL's web site or in QST.

The FCC doesn't have a problem with trackers either through their interpretation of part 97 or simply lack of enforcement action.

Further, if you have a differing view about trackers, don't bother posting it to this list. We've seen it before. If you're new to the list, read the archives to see for yourself. In more than a year of reading this list, I have not seen one person's mind changed on this issue.

         Bill, what ELSE could cause it?  All the files are in the
c:\windows directory, and I've gone so far as to click-and-drag the
mapocx.ocx onto regsvr32.exe and I get similar errors.  The same, really,
except the error message gives me different numbers occasionally.

         Thanks,
         Earl

Hi Bob

Nice to hear from you.

Your practical answer for hams operating someone else's tracker is
obviously true.

However this discussion is about trackers that are
not accessible, e.g, Balloon flights, etc.  Of course the hidden
```

question is what about putting a unit in the vehicle of an operator
who is not a ham and would not necessarily know or want to get
involved in turning it off. i.e. a public service vehicle, a marathon,
a gas balloon flight, all of these applications folks are
interested in doing and yet not losing their licenses.

You may have a corrupt MapOCX.OCX file. The file should be 934,912 bytes.
 Right click on the file in windows explorer and examine the properties.
 Should be file version 1.4.8 I think. Can't recall if there were other
versions distributed. You might want to download another copy of the
MapOCX.OCX and try again.

Try Regsvr32 -u MapOCX.OCX. This will unregister any previous MapOCX
registration. Then try registering the newly downloaded MapOCX.OCX file.

         Got the same error (on both operations), using the good working
copy from my main machine.

         Let me ask -- the laptop is running W95 (4.00.950a).  Will the ocx
work with this version of W95?  Or does something need to be updated?

         Thanks again,
         Earl

700. [aprssig] Q: geographical filtering of posits with aprsd

From: Daniel Wesemann <hb9zig_aprssig@cerveza.ch>
Date: Fri, 21 Jun 2002 12:08:22 +0200 (MEST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86036-2002.06.21-05.45.40--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

i'm planning to extend APRSD with some geographical filtering... I would
like to "split up" the global IGATE feed as follows

- posits originating locally on the digi
- posits originating within (approx) the boundaries of switzerland
- posits originating within (approx) the boundaries of europe
- the full feed

and make each of these available on a separate port.

the first and last function is no problem and supported with aprsd by
default. for the other two, i would need some sort of geographical
filtering on the posit reports. i'm quite sure that this has already been
done - i just need to find out where and how :-)

any hint would be appreciated.
thanks && best regards,
-daniel, hb9zig

Ok,  Dave's letter is copied below

I read it as saying they want to put a tracker on a vehicle
so they don't have to have the ham in the vehicle to provide
commo on where the vehicle is.  The driver is not a ham.
(And it might turn out there are multiple operators as the
drivers go thru their shifts)

So we are back to the original question, Is this fish red?

Jim

---------Dave's Original message--------
Hello all,
   I mentioned to an ARES member that it would be nice to have some
trackers
so that they could be attached to vehicles that we wanted to track and
free
up a ham. We are currently supporting the Hayman fire. About 70% of the
net
time is finding out the current location of this person or this vehicle.
   His question is this legal? How is the best way to respond to him on
this?

Thanks & 73,
Dave N0EOP

It is fully legal under 97.221(b):

-------
(b) A station may be automatically controlled while transmitting a
RTTY or data emission on the 6 m or shorter wavelength bands, and on
the 28.120-28.189 MHz....
-------

An APRS tracker is an automatically controlled telemetry station,
therefore allowed to transmit one-way transmissions, and free of the
need for a control operator. The "devices and procedures for control
of a station when it is transmitting so that compliance with the FCC
Rules" are provided by the software in the tracker itself. It islegal
to put it in a balloon, in a car driven by your wife, non-hams, and
just about anything else (as long as it isn't the normal course of
your own business).

APRS has been around for nearly 10 years, running stand alone trackers
without control ops for almost as long. It is one of the biggest
activities in ham radio, and the FCC is most certainly aware of it. If
they had a problem with any aspect of APRS we would have heard about
it by now.

Can we put this to rest again (at least for 6 months until it
certainly will pop up again, as it has so many times in the past),
please???

Steve K4HG

>
>Is this the latest version of Win95?  Latest patches etc.  How much memory
>is on the machine?

         I can't answer on the patches, in fact, I think this is the early
version of W95.  It's pretty difficult to work with this laptop -- it
doesn't have a CD drive, so I can't load anything else on it without
resorting to floppy disks.

         RAM shows to be at 24 MB.

         I simply ran the batch file, text below:

>copy Regsvr32.exe c:\windows\system\Regsvr32.exe
>copy MAPOCX.OCX c:\windows\system\MAPOCX.OCX
>copy OC30.DLL c:\windows\system\OC30.DLL
>c:
>cd \windows\system
>Regsvr32 MAPOCX.OCX

         That should have everything in the right place, and I've verified
that everything IS in the right place.  The only question I can think of is
whether or not the OS on this laptop is recent enough to work.  What
version is required?

         Thanks once more!
         Earl

One that works<g>. It appears that you have installed all of the files
required by the OCX.  I have used the OCX Win95 without problems.  Try
updating to the last published version of Windows 95 (B?) or install Win98
or later.

Yeh, but since the ham is already there. You'd proably wanna
leave him/her there in case of an emergency (for example, they get cut off
by the fire) so he/she (not the pervert kind)
could get back on the air and keep the CP advised.

Subject: Re: [aprssig] Re: Question about trackers?

Ok, Dave's letter is copied below

I read it as saying they want to put a tracker on a vehicle
so they don't have to have the ham in the vehicle to provide
commo on where the vehicle is. The driver is not a ham.
(And it might turn out there are multiple operators as the
drivers go thru their shifts)

So we are back to the original question, Is this fish red?

Jim

I think aprsd sources are GPL'ed just like Xastir, so you're quite
welcome to borrow from the Xastir sources. One warning though, we
translate lat/long into our own coordinate system, so that'll add to
the confusion factor. We have a function that will compute the
distance from my station, I think in util.c.

You could compute the distance for each station sending a posit. In
this case perhaps you could match up other messages (without a
posit) to the ones with, and then send them through. A better
method would be to hold off all posits that weren't in the area, but
send all status/messages/etc through. You could cache the distance
for a particular station to avoid a lot of the calculations. This
causes other problems if they're moving into/out of the area of
concern.

I suspect the above method will be too slow with a lot of traffic,
so you may just have to create a table of call prefixes, compare the

sending station to that table, and gate the ones through that you've
predetermined to be within the area of interest.

Based on everything the FCC has said, done and not done in the past decade of APRS use, this is a perfectly legal, acceptable use of APRS. Further, this seems exactly what APRS was designed to do and should be encouraged. Why waste voice bandwidth reporting locations when the same thing can be accomplished more accurately and quicker using APRS?

There has never been an FCC enforcement action against anyone (ham or otherwise) using APRS. Ever. (If anyone can find such enforcement action, please document it and make me eat my words. I checked with ARRL and searched the FCC's web site.)

I cringe every time I see this topic come up. We might as well be arguing that PSK31 is illegal.

Attention all APRS and UI digipeating fans.

PCsat is easy to work as an APRS digipeater.

AO-16 is working great as an APRS digipeater. Use PACSAT-1 for
the path when digipeating messages. It require 1200 baud PSK on the
downlink and Manchester FM on any one of its available uplinks.

IO-26 was buzzing as it went over last night, but I was not able to
verify it was operating. We use to use ITMSAT-1 as the digipeating
path on this bird if it is functioning. Since it was transmitting a signal,
I was encouraged that it might be alive.

If ISS is active as a digipeater use RS0ISS as the digi path.

Sapphire and Opal have been available in the past as digipeaters,
so you might want to check them out as well.

Looking forward to make the digital birds come alive on Field Day.

You are absolutely incorrect in your conclusion that a telemetry station does not require a control operator. It is clearly stated in BOLDFACE, under 97.7 that each station must have a control operator.

A telemetry station may be operated under either direct or automated control. To comply with automated control, it must be able to respond to interrogation from the control or auxiliary station.

As a control operator of ANY station, you must "ensure the immediate proper operation of the station, regardless of the type of control" (97.105) The "watchdog timer" as has been mentioned does not eleviate the requirement of a control operator or satisfying the intent of automated control. Even for repeaters, they must include a 3-minute time-out function in the event of the failure of the control link, or the control operator's ability or desire to effect control.

Automatically controlled digital stations must be able to respond to interrogation from a control station that is being controlled either locally or remotely. The control station cannot be under automatic control. (97.221)

So, DUMB TRACKERS are illegal if not operated under direct (local) control because they cannot respond to interrogation from the control station. A control operator CANNOT EVER delegate his responsibilities to an unlicensed individual. Giving a tracker to your unlicensed buddy and telling him to "turn it off if I call you on the cell phone" is ILLEGAL. If you place a dumb tracker in a vehicle there had better be a licensed Ham there to control it. If you place a tracker in a vehicle without a Ham, it must be secured to prevent unauthorized use, changing frequency, etc. Personally, I don't agree that it does not constitute 3-rd party traffic, but I'm not going to argue that any more.

One VERY IMPORTANT aspect of CFR's that few people recognize is the principal of "included" and "excluded" authority. Just because you are permitted to HAVE a telemetry transmitter in one part of the regs, does NOT give you blanket authority to ignore more restrictive, general requirements in another part. You can't ignore control operator responsibilities or the need for adequate control provisions by hiding under the guise of being a telemetry station. Some requirements are INCLUSIVE to all aspects of station operation; control is one of them, as well as the need to maintain adequate security of your equipment to prevent unauthorized transmissions.

And NO, I WILL NOT drop it, shut up or bury my head in the sand when someone asks an innocent and relevant question. You do what you want with your license, ignore the requirements of station control or security, I don't care. But I won't tell someone its fine when it isn't.

It is fully legal under 97.221(b):

(b) A station may be automatically controlled while transmitting a
RTTY or data emission on the 6 m or shorter wavelength bands, and on
the 28.120-28.189 MHz....

An APRS tracker is an automatically controlled telemetry station,
therefore allowed to transmit one-way transmissions, and free of the
need for a control operator. The "devices and procedures for control
of a station when it is transmitting so that compliance with the FCC
Rules" are provided by the software in the tracker itself. It islegal
to put it in a balloon, in a car driven by your wife, non-hams, and
just about anything else (as long as it isn't the normal course of
your own business).

APRS has been around for nearly 10 years, running stand alone trackers
without control ops for almost as long. It is one of the biggest
activities in ham radio, and the FCC is most certainly aware of it. If
they had a problem with any aspect of APRS we would have heard about
it by now.

Can we put this to rest again (at least for 6 months until it
certainly will pop up again, as it has so many times in the past),
please???

Exactly where does it say this? Automatic control is, by the FCC definition "The use of devices and procedures for control of a station when it is transmitting so that compliance with the FCC Rules is achieved without the control operator being present at a control point." The "telecommand" requirement is one you are making up. There is no mention of a need for a "control or auxillary station" in the automatically controlled rule. This is pure fantasy.

The "devices and procedures" are inherent in the tracker software in this case. Nowhere in the rules does it say what methods and procedures are required, how many levels of redundancy there must, what the probability of failure must be, just that there must be something.

The requirements for automatic control are in 97.109(d): "When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this Part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations." It does not say in 1 second, 10 seconds, or 1 hour. It does not say there must be telecommand command of an automatically controlled station.

Furthermore, this section actually makes it crystal clear that an automatically controlled station does not need telecommand, or any other operator presence. The control point is "The location at which the control operator function is performed". There is no ambiguity here...the control operator need not be at the point where his functions are performed! He can be at a distance from the control point!!!!

>Automatically controlled digital stations must be able to respond to
>interrogation from a control station that is being controlled either
>locally or remotely. The control station cannot be under automatic
>control. (97.221)
>
The rules do not say any such thing, in fact they say exactly the opposite. The control opertor need not be at the control point! A simple, clear, completely unambiguous statement. By saying a telecommand link is required, you are saying the operator is required to be at the control point. The rules say just the opposite!

Automatic control means exactly that...the control is automatic. As the control operator of record, you are legally responsible for the correct operation of the station, and if notified of a problem by the EIC you must cease operation. I can do that by driving to the location of the tracker and flipping the power switch, most certainly I am going to notice the problem and do it long before the EIC gets involved. You are fantasizing that the requirement is any more strict than this.

The only way to violate the FCC rules is to not have a means to shut down, or to ignore the directives of the Engineer-In-Charge to shut down.

I definitely plan to work PCSAT and ISS tomorrow. I know this has been discussed on the sig, but I'm still unsure about a couple of things. How many contacts via these sat digis can we log for points? I think they are 3 points each, and you get 100 "bonus" points for having an aprs station (non-traditional mode). QSO consists of a two-way message- eg:bulletin to "CQ FD 5A-STX" and the corresponding QSL. Is this correct? One last thing-no points for QSO via terrestrial digi, correct?

Thanks all- this is my first field day.

The KB0TVJ-11 balloon is at 57,000 feet, some nice findU displays:

http://www.findu.com/cgi-bin/track.cgi?call=KB0TVJ-11

http://www.findu.com/cgi-bin/tele.cgi?call=KB0TVJ-11

(it is sending altenate RMC and GGA sentences, so hit reload every
minute or so to see the altitude or course/speed data.

Hopefully the FCC won't shut this down ;-)

Steve, all that stuff about ballons was a "red herrin'",
in others words somethin' to get you off track (no pun intended).

Of course, you can have trackers without a contol op.

Point is in a wild fire situation, you'd want the tracker for the mundane
trackin'
and a real ham with a radio to contact you in case of an emergency or for
other info
besides "Car 54, where are you?"   Reminds me of "General" David Denkins
:-)

I think this sums it up and we should move on . Unless a newer set of rules
out dates these.. they should be pretty clear...

Directly from FCC Rules CFR 47 part 80 to end revised October 1, 1999

I am quoting in most relevant order....

"An auxiliary station may be automatically controlled" 97.201(d)

"An auxiliary station may transmit only on the 1.25m and shorter wavelength
bands,except 219-220 Mhz, 222.000-222.150 Mhz, 431-433 Mhz, and 435-438 Mhz
segments" 97.201(b)

"Any amateur station licensed to a holder of a Technician " ..... "Class
operator license may be an auxiliary station" 97.201(a)

"An auxiliary station may transmit one-way communications" 97.201(e)

97.109 "Station Control"
(a) "Each amateur station must have at least one control point"
(b)
(c)
(d)" When a station is being automatically controlled, the control operator
need not be at the control point. Only specific stations designated
elsewhere in this part may be automatically controlled. Automatic control
must cease operation upon notification by an EIC that the station is
transmitting improperly or causing harmful interference to other stations.
Automatic control must not be resumed without prior approval of the EIC."

Anything I need to know about APRS in Denmark other
than it is on 144.8125 (per http://aprs.dk/)?
I leave for Denmark (primarily Aarhus but also
Copenhagen) tomorrow evening for ten days of business.
I know I can operate there with just a copy of the
FCC's CEPT notice (DA 99-2344) and a well-placed slant.
Is there anything else I should know? This is the first
time I've operated outside the Americas.
With any luck, I'll be able to get into PCSat and
send a message home.
(I know better than to ask for a Danish path --
we're all still sore from the tracker discussion. {grin})

Matt (k4mls)

97.3(a)
(7) Auxiliary Station. An amateur station, other than in a message
forwarding system, that is transmitting communications point to point
within a system of cooperating amateur stations.

If this is taken to say Trackers are not Auxiliary Stations, but are then
classified as "Message forwarding System" stations, then ...

The rules for packet take over and AUTOMATIC is authorized, for all packet
stations above 6 meters...except where may be specifically excluded..

  97.221 "Automatically controlled digital station"

(b) " A station may be automatically controlled while transmitting a RTTY
or DATA EMMISSION on the 6 m or shorter wavelength bands, and on the
28" ...... (HF bands specified)"

97.219 "Message forwarding system"
(a)
(b)
(c)
(d)
         It is half a page but in summary says, the control operator of the
station who sends the first packet into such a system is responsible for
it's legality and primarily accountable, others should discontinue
forwarding if there is an illegal packet of some form brought to their
attention, but the original station control operator is ultimately
responsible, and accountable.

97.3 Definitions
(6) Automatic control. The use of devices and procedures for control of a
station when it is transmitting so that it is in compliance with the FCC
rules and regulations achieved without the control operator being present
at a control point.

(This would seem to include mentioned items like time-out timers, channel
busy monitors etc...)

Least of all I do not think anyone on 144.39 in an area where trackers are
being used would be complaining of interference from said automatic stations...

One of the 2 covers trackers, I suggest we are covered either way and the
thread may be satisfactorily closed...

>
>Is this the latest version of Win95?  Latest patches etc.  How much memory
>is on the machine?
```

I can't answer on the patches, in fact, I think this is the early version of W95. It's pretty difficult to work with this laptop -- it doesn't have a CD drive, so I can't load anything else on it without resorting to floppy disks.

RAM shows to be at 24 MB.

I simply ran the batch file, text below:

```
>copy Regsvr32.exe c:\windows\system\Regsvr32.exe
>copy MAPOCX.OCX c:\windows\system\MAPOCX.OCX
>copy OC30.DLL c:\windows\system\OC30.DLL
>c:
>cd \windows\system
>Regsvr32 MAPOCX.OCX
```

That should have everything in the right place, and I've verified that everything IS in the right place. The only question I can think of is whether or not the OS on this laptop is recent enough to work. What version is required?

Thanks once more!
Earl

```
Some slight confusion... and I misstated "telemetry station" when I
meant to say "automatically controlled digital station"

Your first post stated that control operators were not needed, and that
is never true, under any type of station or operating circumstances.

An automatically controlled digital station must operate:
1)within the assigned frequency segments (HF), or
2) on 6 meters or higher, or
3) on any other frequency IF it can respond to interrogation from the
control station and has 500Hz or less bandwidth

To clarify this, as an example, a GATEWAY station must be within the
assigned band segments to operate automatically (either the HF segments
or above 6 meters), or it can operate anywhere the transmissions are
permitted IF it can be remotely controlled by a telecommand link
(responding to interrogation).

So a tracker is authorized under automated control on 2 meters, IF we
consider a tracker to meet the definition of "automatically controlled
digital station". From all the debates over this, most people consider a
tracker to be a telemetry transmitter.  Personally, I think
```

"automatically controlled digital station" is a DIGI or HF/VHF Gateway, in the same vain as a repeater which can also (well in recent years, but not always!) be automatically controlled, NOT a tracker.

If we DO classify a tracker as a telemetry transmitter, well, we're basically hosed. Why? Because the regulations say absolutely NOTHING about how a telemetry transmitter must be controlled. We could draw a comparison to telemetry transmission from a space station, in that they are permitted to be automatically controlled. However, they must also be able to be telecommanded to terminate their transmissions if necessary. Telecommanding requires either a physical or radio link, effectively just another type of remote control. Thus, for a spacecraft telemetry transmitter, if automated control fails, remote control must be available.

If a tracker containing "devices and procedures" you refer to fail to operate (watchdog timers, etc), as the control operator you must be able to ensure the "immediate and proper operation of the station". If automated control isn't working, then you must either
1) turn off the station, and NOT RESUME UNTIL APPROVED BY THE EIC
2) use another form of control, such as remote or direct

I concede that as the control operator you may choose to operate a tracker under automated control. However, if it becomes necessary, you must be able to respond "immediately" upon notification that the automated controls have failed. If the tracker has no provision for being remotely controlled, direct control becomes your only alternative. If the tracker is halfway across the country in your parents van headed towards Disneyland, I guess you're out of luck. This becomes a judgment call - just how loosely are you willing to interpret the control operator requirements? And how do you deal with "immediately". Certainly it must be considered on a case by case basis; just how did you attempt to respond when it became necessary? Did you act in good faith, did you accept responsibility, were you proactive? Or did you just dump the tracker in the van, wave goodbye and make no provisions to control it if it became necessary?

A station may be operated under TELECOMMAND if it has a radio or wire or other type control link that allows the control operator to perform their duties. It also has to have a 3-minute watchdog timer for the event of losing the control link. In the definition of TELECOMMAND STATION is states that it is used for controlling spacecraft. Further on, in Special Operations, it says any station may be operated by telecommand. A station being operated under telecommand, cannot be under automated control. Dumb trackers cannot be operated under telecommand. They're deaf. Telecommand can be a backup for automated control. An example of a telecommand station: you have a D700 in your car. You use an HT to remotely transmit touchtones to the D700 to change modes or frequencies. The HT is your telecommand station or control link. Brings up another good question: do any of the radios being sold that can be remotely controlled have a watchdog timer?

No, the FCC does not say you have to have a backup plan, or redundant levels, except in the case of spacecraft. Although redundancy is implied in the requirement for 3-minute watchdog timers for certain types of stations, especially those under telecommand. And all of those types of stations are in the same section of Part 97 where trackers will be classified. Often, in CFR's, something is implied or intended merely by associating it with similar things - this is the "inclusion principal" I referred to earlier. Something does not necessarily need to be specifically stated in order for the intent to be conveyed.

I'm not concluding that a tracker absolutely falls into one category or another. I fully understand that a control operator using automated control is NOT at the control point. But they must be able to ensure the immediate proper operation of the station. I am not saying that this can be defined conclusively and in all cases as a specific amount of time. Certainly there must be flexibility to accommodate many types of unique situations. I do not feel that placing a tracker in a vehicle with unlicensed people and sending them off on a cross-country trip satisfies the intent of being able to do anything "immediately". But you and I are well aware of many examples relayed on this SIG of situations that would certainly be closely scrutinized if the tracker had locked up in TX mode.

I personally had my home station, when it was doing weather, lock up in TX. I discovered it when I cam home from work, the transmitter was scalding to the touch, and I have no idea how long it had been that way. Apparently no one knew how to contact me at work. I had not checked it before leaving that morning, so it's conceivable it was locked up for 12 hours or more. Obviously the watchdog timer didn't do its job. I will likely never leave an unattended station online, capable of transmitting, without supervision.

I do not feel that in most situations the benefit justifies the risk. But each person must make up their own mind.

The use of trackers for public service and emergency response is a noble cause. I will likely not give one to an unlicensed individual without great consideration. I won't support the use of dumb trackers for any purpose except dire emergencies.

Should we suggest placing contact the contact information of the control operator into beacon texts of unattended/unlicensed hosts trackers? Certainly that would facilitate contacting the control operator in the event something went wrong. But in the case of a tracker locking up, it would not keep transmitting the beacon, so the last beacon heard would have to suffice. As a minimum I suggest placing a label on the tracker with you name, address and tele number.

>

Exactly where does it say this? Automatic control is, by the FCC definition "The use of devices and procedures for control of a station when it is transmitting so that compliance with the FCC Rules is achieved without the control operator being present at a control point." The "telecommand" requirement is one you are making up. There is no mention of a need for a "control or auxillary station" in the automatically controlled rule. This is pure fantasy.

The "devices and procedures" are inherent in the tracker software in this case. Nowhere in the rules does it say what methods and procedures are required, how many levels of redundancy there must, what the probability of failure must be, just that there must be something.

The requirements for automatic control are in 97.109(d): "When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this Part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations." It does not say in 1 second, 10 seconds, or 1 hour. It does not say there must be telecommand command of an automatically controlled station.

Furthermore, this section actually makes it crystal clear that an automatically controlled station does not need telecommand, or any other operator presence. The control point is "The location at which the control operator function is performed". There is no ambiguity here...the control operator need not be at the point where his functions are performed! He can be at a distance from the control point!!!!

>Automatically controlled digital stations must be able to respond to
>interrogation from a control station that is being controlled either
>locally or remotely. The control station cannot be under automatic
>control. (97.221)
>

The rules do not say any such thing, in fact they say exactly the opposite. The control opertor need not be at the control point! A simple, clear, completely unambiguous statement. By saying a

telecommand link is required, you are saying the operator is required
to be at the control point. The rules say just the opposite!

Automatic control means exactly that...the control is automatic. As
the control operator of record, you are legally responsible for the
correct operation of the station, and if notified of a problem by the
EIC you must cease operation. I can do that by driving to the location
of the tracker and flipping the power switch, most certainly I am
going to notice the problem and do it long before the EIC gets
involved. You are fantasizing that the requirement is any more strict
than this.

The only way to violate the FCC rules is to not have a means to shut
down, or to ignore the directives of the Engineer-In-Charge to shut
down.

No, you ALWAYS have to have a control operator. If you do not think so,
then you really shouldn't have a license. Not rude, just reality. One
of the few things stated in BOLD, UPPERCASE LARGE FONT in the rules. If
the FCC shouts, we should listen.

Steve, all that stuff about ballons was a "red herrin'",
in others words somethin' to get you off track (no pun intended).

Of course, you can have trackers without a contol op.

Point is in a wild fire situation, you'd want the tracker for the
mundane
trackin'
and a real ham with a radio to contact you in case of an emergency or
for
other info
besides "Car 54, where are you?"   Reminds me of "General" David Denkins
:-)

The KB0TVJ-11 balloon is at 57,000 feet, some nice findU displays:

http://www.findu.com/cgi-bin/track.cgi?call=KB0TVJ-11 http://www.findu.com/cgi-bin/tele.cgi?call=KB0TVJ-11

(it is sending altenate RMC and GGA sentences, so hit reload every
minute or so to see the altitude or course/speed data.

Hopefully the FCC won't shut this down ;-)

Why does this hose us? This is a good thing IMHO. It fits with the
FCC's stated intent, to get away from managing the fine details of the
Amateur Radio Service.

>could draw a comparison to telemetry transmission from a space
>station, in that they are permitted to be automatically controlled.
>However, they must also be able to be telecommanded to terminate
>their transmissions if necessary. Telecommanding requires either a
>physical or radio link, effectively just another type of remote

>control fails, remote control must be available.
>

Some method to turn it off must exist. In the case of a spacecraft,
you cannot go there to do it manually. On earth, you can. This is a
MAJOR difference. It is, in fact, a big reason that space operations
are broken out separately, (the other being the crossing of
international boundaries) and why no rules written specifically for
space ops apply to stations below 50 miles altitude.

Also, be careful that you aren't confusing remote control and
telecommand. Telecommand is ONE-WAY, and has some restrictions, while
remote control is TWO-WAY, and has absolutely no restrictions! The
example of a TNC tracker that allows you to connect and change
parameters, is certainly not telecommand. It is remote control only in
the sense that while you are connected you are remotely controlling
the station. Once you disconnect, it is certainly an automatically
controlled digital station once again.

>If a tracker containing "devices and procedures" you refer to fail
>to operate (watchdog timers, etc), as the control operator you must

>

The "not resume until approved by the EIC" only applies IF THE EIC WAS
THE ONE THAT TOLD YOU TO CEASE OPERATIONS!

>I concede that as the control operator you may choose to operate a
>tracker under automated control. However, if it becomes necessary,
>you must be able to respond "immediately" upon notification that the
>automated controls have failed.

While immediately does appear in the general description of operator responsibilities, it is rather clear the FCC intends more leniency for automatically controlled stations. Otherwise, the control operator would be required to remain at a control point. Since the control operator can be at a distance from the control point, and no definintion of immediate is supplied, no doubt the FCC allows a reasonable amount of time for the control operator to reach the control point or otherwise stop the transmission.

>If the tracker has no provision for
>being remotely controlled, direct control becomes your only
>alternative. If the tracker is halfway across the country in your
>parents van headed towards Disneyland, I guess you're out of luck.

Not at all, I just call them up on the cell phone and tell them to unplug it. That is the procedure I have set up to stop its transmission to satisfy the FCC requirements. There is nothing in Part 97 that says an unlicensed person cannot unplug a transmitter, only that they cannot initiate a transmission.

> Further on, in Special Operations, it says any station
>may be operated by telecommand. A station being operated under
>telecommand, cannot be under automated control.

How can you say that? These two sentences aren't even internally consistent! If any station can be telecommanded, and since an automatcally controlled digital station is a station (by definition), then it must able to be telecommanded.

In the special ops section on telecommand, there is absolutely nothing that says a station under automatic control cannot be telecommanded.

>I personally had my home station, when it was doing weather, lock up

That is one case, 12 hours, in the thousands of transmitter-years APRS had racked up, though no doubt there are a few more similar stories out there. Against that, consider what remote weather stations have done for the NWS and general public, all the special events that APRS supported, the one or more stolen vehicles it has helped recover, all the loved-one's minds that have been reassured...that sure is a lot of good to throw away for a few hours of QRM!

738. [aprssig] d700 for mic-e mode?

From: "Wes Johnston" <wes@johnston.net>
Date: Fri, 21 Jun 2002 21:48:16 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86152-2002.06.21-21.25.43--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I hope this is just me doing something wrong.....

I want to run my kenwood as a mic-e so my posit will go out over the local voice repeater when I keydown. So I want to mic-e out on the right 1/2 of the radio, and still receive aprs data on the left 1/2. The purpose of this is to see when my packet goes into a mic-e compatible voice repeater, I want to make sure it gets to 144.39, and what better way that with my own kenwood rig? I normally run 144.39 on the A side of radio and what ever voice freq I'm using on the B side. So I went into the TNC menu and made TX on B and RX on A. Under the aprs menu, I programmed beacon to PTT. Now the beacon on PTT works fine... when I keydown, the B side of radio tx's. Problem is, the A side never decodes any packets. Now if I QSY the B side to 144.39, it turns out that it's doing the decoding. Is this one of those things you can't do in aprs mode?

Also, it sounds like the TXDelay is a little long.... I remeber Bob B saying
something about change your path to a "3" for ssid type routing packets and
a really short packet... but frankly, if I've done this correctly, I'm a
little set back by the length of this packet. There seems to be no front
panel way to shorten the TXD.

Any suggestions?
Wes

Rendered body type: text/plain

Clearly it is every amateur radio operator's responsibility to possess a
copy of Part 97 and operate their stations accordingly. Every law and
regulation created to date has to be interpreted in some manner, every
Amateur is free to operated their station as to how they interpret the
regulations being, mindful of any action towards them, if they are mistaken.
I will remain silent untill someone's activity interferes with mine and
other's operating, otherwise other's operating practices don't concern me.

In normal daily activity I wouldn't place a tracker in a vehicle that I
don't have easy direct control of because I feel, that is contrary to, the
basic spirit of station control. In extra ordinary times I would yield to
basic premise/spirit of amateur radio's importance in times of emergency and
USE a tracker in the manner being discussed. What if I'm wrong? The FCC can
have my ticket, my effort, time and money could be put to use elsewhere, if
they decide to push too hard on what would be a rare event.--73
Doug, N0LKK
dougy@ruraltel.net

PS; just read Stan's post and hope the above was in a civil manner, most
likely this will be my only and last post to the sig on the topic

Rendered body type: text/plain

I am trying to get AA8EI's tinytrak and tripmate working...

I need to ask someone that has mated these devices questions...

I have done the autostart mod.

I took the Serial Out from the GPS thru a 10K resistor and connected it to
the CHIP SIDE of R14 (10K resistor) so that I can connect the computer and
the GPS to the TT2 at the same time.

My problem is that I see the RED (power) LED and the YELLOW (busy channel)
LED, but it never goes into transmit.

I tested each device, and I see the GPS data in the terminal mode...

Suggestions? what am I missing??

Bob

My first response to so little detail of your full setup
parameters, how is it set as far as "transmit on valid data"
is set? If you are trying to get it to work in doors, and
you have it set to transmit on Valid data only, then you may
never transmit.. Check it out..

I have sent messages to aprs stations, so all you need to do
address messages to EMAIL instead of a "station" so,

To EMAIL
email address <space> message

Good luck,

Robbie wa9inf

Rendered body type: text/plain

When I say that a station under telecommand cannot be under remote control, I intended to mean that the two methods cannot occur simultaneously. It's one or the other during the time that the method is in use.

When I mention telemetry and compare APRS to space telemetry, it is only because that is the only example the FCC has provided. Without further clarification, all I can really do is look at space telemetry and draw conclusions about APRS telemetry that seem reasonable and hope that they meet the intent of the regulations. But I really have no clue what the FCC intends for telemetry as it only provides one line, acknowledging that it exists.

I think the space telemetry is a good example, though, because as you stated, you can't drive up to the spacecraft and throw a switch. Similarly, if we deploy a tracker to a remote location, or an unknown location or location that is inaccessible, we must consider whether we CAN comply, and have a reasonable expectation of being ABLE to maintain control of that station. Knowingly sending a tracker off on a "3 hour tour with Gilligan" and making no provision to be able to access it shows that the control operator had no regard for his responsibilities. They just took a chance that nothing would go wrong and hoped for the best. At a minimum this is irresponsible and could be considered negligent or even intentional if the need to control it arises and the control operator just throws up his hands.

We can't assume that we will always know the location of a tracker - it may be in one of the many RF black holes around the country, maybe it's not hitting a DIGI or gate. Just because it might only be transmitting to a small geographic area does not lessen the need to maintain control of it.

I can never agree that your system of "telling someone else" to just turn it off is appropriate. That is just delegating your responsibility as control operator, and you CANNOT give control operator responsibilities to anyone other than a licensed Ham who is qualified to act in that capacity. Maybe it accomplishes the intended goal, but I don't think it comes anywhere near satisfying the intent of the section on control operator responsibilities.

The whole issue of TELECOMMAND is confusing. I have never personally had any experience with it. I'd bet there are a lot of others in the same boat and are just as confused as I am. The regs talk about telecommand and seem in various places to imply that it is one-way. One example is telecommanding a model aircraft. I don't think there is any feedback except the visual cues you get as it careens to the pavement. If you are telecommanding a station, what feedback do you get that confirms that the commands had their intended purpose? If you're going to change frequency, wouldn't it be useful to know WHAT freq the radio changed to, just as a precaution? How would you even know that the station recognized the command to exit command mode and resume operations? Or is telecommand a continual process, thus the need for a 3-minute timer?

Likewise, auxiliary stations are also somewhat mysterious. The only examples I can think of are linked repeaters. Is this right?

One thing does bother me though, Steve. You seem to classify trackers as telemetry AND automatically controlled digital stations interchangeably. I get the impression a lot of people classify various aspect of APRS on the fly, however it benefits the situation at hand. Which ever you choose, I think you should stick to it.

>basically hosed. Why? Because the regulations say absolutely
>NOTHING about how a telemetry transmitter must be controlled. We

Why does this hose us? This is a good thing IMHO. It fits with the FCC's stated intent, to get away from managing the fine details of the Amateur Radio Service.

>could draw a comparison to telemetry transmission from a space
>station, in that they are permitted to be automatically controlled.
>However, they must also be able to be telecommanded to terminate
>their transmissions if necessary. Telecommanding requires either a
>physical or radio link, effectively just another type of remote
>control. Thus, for a spacecraft telemetry transmitter, if automated
>control fails, remote control must be available.
>
Some method to turn it off must exist. In the case of a spacecraft, you cannot go there to do it manually. On earth, you can. This is a MAJOR difference. It is, in fact, a big reason that space operations are broken out separately, (the other being the crossing of international boundaries) and why no rules written specifically for space ops apply to stations below 50 miles altitude.

Also, be careful that you aren't confusing remote control and telecommand. Telecommand is ONE-WAY, and has some restrictions, while remote control is TWO-WAY, and has absolutely no restrictions! The example of a TNC tracker that allows you to connect and change parameters, is certainly not telecommand. It is remote control only in the sense that while you are connected you are remotely controlling the station. Once you disconnect, it is certainly an automatically controlled digital station once again.

>If a tracker containing "devices and procedures" you refer to fail
>to operate (watchdog timers, etc), as the control operator you must
>be able to ensure the "immediate and proper operation of the
>station". If automated control isn't working, then you must either
>1) turn off the station, and NOT RESUME UNTIL APPROVED BY THE EIC 2)
>use another form of control, such as remote or direct
>
The "not resume until approved by the EIC" only applies IF THE EIC WAS THE ONE THAT TOLD YOU TO CEASE OPERATIONS!

>I concede that as the control operator you may choose to operate a
>tracker under automated control. However, if it becomes necessary,
>you must be able to respond "immediately" upon notification that the
>automated controls have failed.

While immediately does appear in the general description of operator responsibilities, it is rather clear the FCC intends more leniency for automatically controlled stations. Otherwise, the control operator would be required to remain at a control point. Since the control operator can be at a distance from the control point, and no definintion of immediate is supplied, no doubt the FCC allows a reasonable amount of time for the control operator to reach the control point or otherwise stop the transmission.

>If the tracker has no provision for
>being remotely controlled, direct control becomes your only
>alternative. If the tracker is halfway across the country in your
>parents van headed towards Disneyland, I guess you're out of luck.

Not at all, I just call them up on the cell phone and tell them to unplug it. That is the procedure I have set up to stop its transmission to satisfy the FCC requirements. There is nothing in Part 97 that says an unlicensed person cannot unplug a transmitter, only that they cannot initiate a transmission.

> Further on, in Special Operations, it says any station
>may be operated by telecommand. A station being operated under
>telecommand, cannot be under automated control.

How can you say that? These two sentences aren't even internally consistent! If any station can be telecommanded, and since an automatcally controlled digital station is a station (by definition), then it must able to be telecommanded.

In the special ops section on telecommand, there is absolutely nothing that says a station under automatic control cannot be telecommanded.

>I personally had my home station, when it was doing weather, lock up
>in TX. I discovered it when I cam home from work, the transmitter
>was scalding to the touch, and I have no idea how long it had been
>that way. Apparently no one knew how to contact me at work. I had

>was locked up for 12 hours or more. Obviously the watchdog timer
>didn't do its job. I will likely never leave an unattended station
>online, capable of transmitting, without supervision.
>

That is one case, 12 hours, in the thousands of transmitter-years APRS had racked up, though no doubt there are a few more similar stories out there. Against that, consider what remote weather stations have done for the NWS and general public, all the special events that APRS supported, the one or more stolen vehicles it has helped recover, all the loved-one's minds that have been reassured...that sure is a lot of good to throw away for a few hours of QRM!

I put the GPS/TT2 and radio on the deck and it never went into transmit. I see the yellow (busy channel) and red (power)leds.

Tomorrow, during the daylight, I need to verify that the GPS is even working.

As far as I know, it doesn't work <g>. Yes, we can send one-line emails.

I think your question was about the feature to 'Enable Igate One-Line Email (via SMTP)' in settings. One would assume that the function would allow any Igate to become an SMTP server, to forward emails from other APRS users.

This is getting crazy <grin>... The "intent" here is to turn off an
offending transmitter. If the transmitter gets turned off because I ask
someone to reach over and flip the switch for me, it is still under my
control.

I guess by these silly interpretations of the rules, one cannot be wearing
a pair of gloves when operating a HAM transmitter because you are not in
direct control. THe gloves which are un licensed, and not manufactured in
accordance with the rules are not allowed to be used in the control of a
tramnsmitter.
Further, there is no provision in the FCC rules that addresses controlling
a transmitter with gloves on, so therfore it must be illegal...

Geeze...

Somehow this comes to mind....

"After having thus successively taken each member of the community in its
powerful grasp and fashioned him at will, the supreme power then extends
its arm over the whole community. It covers the surface of
society with a network of small and complicated rules, minute and uniform,
through which the most original minds and the most energetic characters
cannot penetrate, to rise above the crowd. The will of man is not
shattered, but softened, bent and guided; men are seldom forced by it to
act, but they are constantly restrained from acting. Such a power does not
destroy, but it prevents existence; it does not tyrannize, but it
compresses, ennervates, extinguishes and tupefies a people, till each
nation is reduced to nothing better than a flock of timid and industrious
animals, of which government is the shepherd."
-Alexis de Tocqueville

I know, this is nuts. Control operator does not automatically pass for the slightest touch of a piece of equipment. If someone has a repeater at their house, and the normal chain of control fails, a spouse doesn't suddenly become the control operator because someone makes a call home and say "Hey honey, the machine is sick, can you pull the plug?"

I think people are looking for questions here because they want to make an answer first.

Mike

Rendered body type: text/plain

Hello All,

For your information.

There are new PocketAPRS maps, this time for Scandinavia (Norway, Sweden and Denmark) and one for Denmark. These are are also usable with APRS/CE, Xastir, MacAPRS and WinAPRS.

I know Sweden and Denmark well and is a shame I did not come up with these earlier...

Note dat the Scandinavian map is rather big, so if your palm is only 2 MB then you may encounter a storage space problem... I upgraded my palm to 8 MB and it is very nice to be able to hold some maps and some useful applications at the same time!

```
You can find the new maps, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
or
http://home.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).

Kind regards,

Henk.

```

```
Hi Everyone,
A while ago I asked a question of the members of the sig.  It had to do with
battery types and which one was best suited to be used in an environment where
```

```
partial charging and partial discharging was the rule, rather than the
exception.

I received three replies.  The overall 'gist' is that the battery designed for
such things is the sealed lead-acid (gel cell).  Given the poor power density of
same the next best is Lithium Ion with the next best being a very distant third.

One other aspect that I hadn't mentioned -- but for which I've done web-based
research -- is the issue of overcharging.  It is obvious that best battery life
will be had by assuring overcharging doesn't occur either -- a function of the
charging system.

So...it looks like I'm going to look at a laptop solution with Lithium Ion
batteries with overcharge protection built-in.  My need is to explore this for a
public school system and want to go in with eyes open.

Thanks deeply to Mark, Steve and Terry for their insights.  My appologies to
those folks who rolled their eyes when I asked the question; knowing that the
sig just got over a v-e-r-y long thread on exactly this topic (I tried following
it, but there were so many hot opinions that seemed to contradict, I had to
ignore it after a while).

Thanks, Stan for the moment with the folks on a non APRS topic.

Returning to normal programming... <smile>

Rendered body type: text/plain
```

```
I'm sure this has been dealt with before, but I'm new to this group.
I have an MFJ 1270C.  Can it be used as-is on APRS, or does it need any
modifications?

Thanks and 73
Harvey, KM4JA

I just got my 1270C working (with a little help from my friends) -  it
worked just find after I but in a fresh battery - the old weak battery was
causing lots of problems.

759. [aprssig] Capture Kam Display

From: Glenn Wiebe <gswiebe@mb.sympatico.ca>
Date: Sun, 23 Jun 2002 10:51:08 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86333-2002.06.23-11.28.30--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all:

The settings of the Kam (all 175 or so) when configured for WAPRS 2.5.1
can be viewed with Windows/Terminal Window and typing Display. Anyone
know how to capture this info and save it as a text file? This could
come in handy some day - like after a hard reset. I could copy the file
to the WAPRS folder, rename it "inithf.tnc" and start the program. Of
course the pc and the Kam would have to be on speaking terms.

Thanks

Glenn...VE4GN

If you can't find a Log to File command, then pretend you're receiving a
text file. There should be a File Transfer command.

Rendered body type: text/plain

Sorry folks (about PCsat):

About all you could hear from PCsat during the evening FD passes was faint little BEEPshssss... as the batteries were so low that they could not even get through a 1 second packet. Even so, I did copy the following successful users on the evening passses:

PCsat Sat PM East USA: K5OE, WB4APR, N8DEU, KB0VBZ, VE5AA, N1FD, N9IDH
PCsat Sun AM West USA: KD7HGL   <= copied on pcsat.aprs.org
UO-22 Sat PM East USA: N9IDH, W4JBB
NO-45: All you could hear were the two "OK" beeps. Digieater was inop.

PCsat should have worked... but.... At 2 AM friday night, I returned from 1 week family trip and 17 hour drive and at 3AM and 5AM, we had PCsat in the right mode and it was working fine. But sometime in the next several hours while conducting PCsat GPS operations from other command stations around the world, the GPS got left on, and it ran the batteries down.

Sorry about that...

de WB4APR@amsat.org, Bob

Bob,

Thanks for the confirmation on UO22. I didn't know if I got out or not. Murphy bit really hard this year:

1. 1.2m Primestar dish is bent at some point - the focal point is off by about 6 inches. I found this on Friday and took it down and put back up my BBQ grill dish.

2. Tried to build another 2.4GHz dish on Saturday with an old 18" DSS dish. It rained on and off all day and I never got the antenna on my tower.

3. Due to the rain, all 6,435,987 Southern Yellow Pines in my yard were saturated and my signals on 70cm were severely attentuated.

4. Something appears to be wrong with my xcvr on SSB on both 2m and 70cm in which I only get about 10W out on both. HF seems fine on the same rig.

This was not a good year for FD from EM62!

Live and learn. I now have a year to prepare...

Better luck next year...

73,

Joel Black, W4JBB

Rendered body type: text/plain

A large number of OEM GPS boards and GPS receivers have hit the surplus market over the last few months (BG Micro, eBay, hamfests and computer fairs, etc.) - which are being used for tracking OR timing applications. Many of these OEM GPS receivers require interfaces from TTL to RS-232 signals for operation with a PC or PDA.

Remember to MATCH the GPS receiver with the correct GPS antenna (Newer receivers and antennas are moving to 3 VDC, from the earlier 5 VDC)

Schematics, documentation and offerings for GPS receivers.

On Saturday evening VE5AA copied the following stations via PCSat:
K5PRK, W6YDG, WB4APR, KD7HGL and ourselves, VE5AA.

There may have been more but the RF from our 20m station caused my TNC to
keep resetting itself. I've never had that happen before. That's Field Day
for you!

769. [aprssig] DIGIpeater CAPABILITIES MAP

From: Bob Bruninga <bruninga@usna.edu>
Date: Sun, 23 Jun 2002 20:09:58 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86362-2002.06.23-19.47.26--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

DIGIpeater SYSOPS check out this web page. It is a map of the 160 digis
in the USA that do not have any Overlay character on them to show users
what capabilities are avaialble in their areas.

http://www.ew.usna.edu/~bruninga/digi-overlays.html

This is not meant as criticism at all. I konw how hard it is to
get-around-to-it. This is meant just as a reminder that when someone has
the time, it would be nice if all digipeaters included the Overlay
character to show users what capabilities are avaialble in a given area...

Once we get all the digipeates marked, then it will be trivial to use
javAPRS to show a LIVE digipeater MAP colored by what kind of DIGI
capabilities are avaiable in each area...

This is the long term goal.. So, check out the map and lets see if we can
eventually upgrade these digis...

Thanks

Rendered body type: text/plain
```

```
Plans are well underway for the second annual Great Plains Super
Launch, to be held in Manhattan KS over the 4th of July weekend.
The activities begin with a symposium on the Kansas State
University campus on Friday the 5th at 9am CDT, where a number of
Amateur Radio high-altitude balloon groups will give
presentations about their group, plus some in-depth presentations
about various aspects of this hobby.

The launch itself is scheduled for Saturday, July 6th, between
approximately 1200 and 1400 UTC from a site about 9 miles south
of Manhattan (39 deg 05.072' N 96 deg 39.343' W).  At present,
seven balloons are scheduled to be launched that morning.  If
Saturday's weather is unfavorable, the backup date is Sunday the
7th.

There are a variety of payloads planned to be launched.  Six will
have APRS,  three will have 70cm ATV, three will have a simplex
repeater, and two will have a cross-band repeater.  In all, 6m,
2m, 1.2m, and 70cm will be utilized for this event.  We will use
144.34 MHz as the primary APRS frequency for this event, and hope
to have I-gate coverage from a station in the region.

More information, including frequencies and callsigns, can be
found at http://users.crosspaths.net/~wallio/GPSL2002.html or by
e-mailing me.  Anyone interested is invited to attend the
symposium and launch free of charge.

I noted one of those on the map was the
State EOC Warehouse (K4OGB) for NC.

It is the station there and does have RELAY
alias.

The warehouse was recently mnoved from Raleigh.

What sorta overlya should it have.

I don't have a 12XL, but I believe on that model there is an internal lithium cell that is 'inside' the waterproof seals. That means it has to go back to get resealed after replacement.

I don't know how hard it is to do the battery yourself.

Mike

Well, since every APRS station except mobiles is supposed to have the
alias of RELAY, then it seems to me that an EOC should not be using the
DIGIpeater ICON.  Use the EOC icon or (if this is a remote warehouse not
near the actual EOC, then use sokmething else).  Or if it is really only a
TNC with no PC or users or no other application at all and is  intended as
a RELAY only fill in digi, then overlay it with an "R".

Thanks for considering this
Bob

Bob,

As long as the yellow LED is on, the TT will not transmit.  Have you
adjusted the level of receiver pot so that the yellow LED is only on when a
signal is present?

Is the green LED lit or flashing when the GPS in on and connected?

I've built three of these now and use the eTrex.

Lemme know.

(Embedded image moved to file: pic04211.pcx)
Hi Everyone,
A while ago I asked a question of the members of the sig. It had to do with
battery types and which one was best suited to be used in an environment where
partial charging and partial discharging was the rule, rather than the
exception.

When I first started using APRS a mere 2 years ago, I used the WHOIS
service quite a bit. Now it seems to be gone, at least in this area.
What software supports it and is anyone still running it?

For those who are scratching their heads, I could send a message to
WHOIS CallSign, and the excerpt from the FCC database would comeback to
you via APRS Messaging.

Dick Reichenbach - KC8OBZ

Bob:

We control or support all of the digi's listed below EXCEPT W1LH-10 and KB5WBH-9.
We'll put a plan together to update them with the "U" ASAP.

With regard to PHG, we've had an ongoing discussion regarding it's functionality. Since we have repeaters at most of these sites, we know what the actual coverage is. The difficulty has been to come up with a corresponding PHG that will accurately represent the coverage pattern. One of our members has been playing with an Excel spreadsheet to do this. Suggestions?

> It does have the EOC Icon!

Ah ha! GOing back and looking at the raw data captured from the internet,
I see that that line is garbled by the internet, so what was plotted on
the maps was bad data..

Here is what was in that file under that call:
K4OGB     :=3521.  N/08012.  WoW4GS-5>APRSW,N1NFC-1*:!3354.81NN07902.70W#PHG7460

It appears to be a concatination of two packets.  And in fact, it does
show the EOC icon (o).  But the database filter used to build those maps
was based on "W#" which it picked up from the second half..

So no problem at all with that station.

Bob

It is a problem.  THE PHG's all appear to be very optimistic.  And they
DO somewhat work for non-moving base stations.  But for mobiles, the
range to the same digi is much-much worse...

This is because mobile multipath flutter creates 30 dB fades while a car
is in motion. No problem for voice, but disasterous for packets which must
be perfectly error free.

I think it is time to revamp all PHG displays to povide TWO circles.  One
for basestations and one for mobiles...  now th equestion is, what is the
reliable mobile range?  Any input would be appreciated!

Thanks

```
Reminds me of a test I did a couple of years back...

While on a trip from Wilmington back to Raleigh, I listened for a certain
highly placed Digipeater here in NC (KD4PBS).  Because nothing was heard
along I40 coming out of Wilmington... I just kept monitoring....

I started hearing broken packets at 50 miles from the digi... I decoded the
first packet at 30 miles from the digi... and I started getting solid
decodes on all packets at 20 miles from the digi.

This was using a Kenwood D7.... with a quarter wavelength mag mount ....
obviously with better antenna and better receiver the "milage" would vary...

An interesting idea... one we use for our Mobile Data in the Public Safety
sector.... there we have Tower coverage maps... but what we USE is the
"talkback" maps.... the operative portion of the communications being the
limitations of the mobile (given they have much lower power output than the
tower... and a much more compromised antenna and antenna location (on the
vehicles)...

I'd say this would be a good idea ....   now the killer issue... maybe the
two "rings" should be for a 5watt mobile with a rubber duck antenna... and a
25watt mobile with a good (but "average") external antenna...

my 2 cents... and it follows what is used in the Public Safety sector for
showing coverage maps....

http://www.cheavens.com/mark/radio/packetradio/PHGAPRS.xls

This is the link to the spreadsheet in question. There are actually TWO problems with PHG currently.

If I use the proper PHG numbers for the AI5TX-2 digi in Houston it would yield a radius of 86 miles. This is NOT possible!
(110W 500ft 5dbd)

Instead I adjust all numbers to show a "real world" radius for mobile users.

The secondary problem has to do with APRS SA+ (not a problem of the aprs sig) but it does not compute the radius properly and adjusts the circles to a smaller radius.

Just my .01 worth,

Mark Cheavens

I agree completely. The simplistic PHG formula in APRS was derived to give approximate results for typical home stations with PHG's around 100 feet or so. Back then there were no digipeaters and the early users had to use each other for digipeating (RELAY). I agree that it is not correct for drastically higher HAAT's. Your approach of adjusting the numbers to get the "right" answer for your location is the best approach. Good work...

There are mobile coverage predictions available from Motorola, based in several old mobile service manuals.. they go by antenna gain, roof or trunk mount,and frequency band.

This may be a basis to estimate the mobile coverage circle (ie, how far can the mobile talk/ hear)

Also, I believe we should use this as the "reference":
1. 25w transmitter power, .5 rx sensitivity
2. Unity gain antenna (1/4 wave) roof mounted

Those using compromise antennas or 5w HT's or less will get correspondingly less coverage for their particular setups.

PHG should accurately reflect what coverage a mobile can expect.
My suggestion would be for two circles both of which are based on talk-back
not talk-out range.

Circle one = 5 watt mobile to a mag mount ground plane in the center of the
roof of standard sedan (Taurus or similar)

Circle two = 50 watt mobile to a mag mount ground plane in the center of
the roof of standard sedan (Taurus or similar)

I would further suggest calling for a standard of a full size high quality
mag mount using good coax not one of the Hershey Kiss micro mags. I have
one and it works much better than a rubber duck but is noticeably below
bigger models on both receive and transmit.

These power levels are basically standard for trackers using hand-helds and
mobiles rigs respectively. I think that Mag Mounts ground planes should be
the standard antenna for the test as it is widely available and requires no
mod to a vehicle for testing it also makes a good antenna for PCSAT and ISS
as Bob has noted in the past. Once testing is done and range circles are
available that reflect actual performance then testing can be done to
compare antenna systems. I do not believe that a rubber duck should be
used as a reference as there is far too much variability in the performance
even with in a given brand.

My experience with the KC4ZGQ-9 45-watt tracker is that PHG is to be blunt
essentially useless as currently implemented. The actual talk-back to most
digi's is often closer to 5-8 miles for digi's with PHG's that cover half
of a state. I am hopeful that Bob and others may be able to tweak the
standard to add a second circle. Perhaps by redefining PHG to PPHG = to
5watt 50 watt Height Gain.

This thread reinforces the need for any home station that can to function
as a relay.

Updated web server showing position, status and callsign. See http://kh2z.lynxstudio.com. Callsign entry for find "Near" stations requires the exact callsign and is case dependant. If you are looking for WB4APR-9, don't enter wb4apr-9.   Data and Map calculations are not case dependant, and a partial match will be returned. You can enter multiple callsigns, separated by either a comma or a space if desired. This is just a little experiment and the web page may disappear or change at any moment. Feedback would be appreciated. Brent KH2Z

APRSdata serves out OBJECT reports for all satellites in view and can also
serve out the Space shuttle. BUT, since the space shuttle maneuvers all
the time, and this requires daily downloads and updates to the Tracking
Elements, the amount of maintenance is not worth the trouble for other
reasons:

1) Shuttle mostly goes to and from ISS which is already reported
2) Old data is worse than NO data. and since you cannot predict when it
   will maneuver, then it is too risky to autmoatically put out the
   objects which might be out of date...

Or at least that is why I dont do it on my copy of APRSdata.

P.S. while I was on my 1600 mile round trip to alabama I was very pleased
to see ISS and PCsat OBJECTS on my mobile radio to alert me when
satellites were in view... I saw APRSdata satellite objects transmitted
while I was in Tennessee and Virginia and Alabama... (and close to Home in
Maryland)...

One thing that I have been meaning to ask here... Bob, and others, do you all
have your D7A and/or D700s set to beep on all messages so that you know when
to look at the displays for these sats, or do you scan the list at some

```
intervals or what?

I have by D7A set for 'BEEP MINE' and that keeps the noise in the cockpit
(frequently cohabitated with others) to a minimum.

I guess I have BEEPS on so that I see all new packets.  And D700 screen
is right over steering column so it is easy to glance at....  Also, if ai
am bored and radio has been on for several minutes, then I might go check
the DX LIST which should have captured the satellite schedule for the
next 880 minutes.  This is transmitted once every 10 mintues to the DX
list, but is lost every tiem the radio is turned off...

Bob

```
This story describes a future ad-on for cell phone networks that seems to use
the APRS idea that every user also becomes part of the digipeater network.....

ELIMINATE CELL TOWERS, LET HANDSETS SERVE AS NETWORK

Technology developed by SRI International would allow cell phones to
continue operation even when the receiving cell site goes out of
service.  When the company's "PacketHop" software in embedded in the
handset, signals are transmitted from handset to handset until reaching
the final destination.  (Wired News)

ROTFLMAO.

My cell now has ALMOST enough bandwidth to cover one call.
Are they going to pay me for the batteries they chew up, selling my phone's
time to someone else?

No, they're going to cut your call's bandwidth to about 25% of what it is
now, and then charge you about 4x more for the "telelphone infrastructure
fee" (your BS may vary), since they have to keep track of all the cell
phones. Oh, and if your cell phone isn't in compliance, you'll have to buy
a new one. Oh yeah, and don't forget a fee to be part of the
next-generation P2P cell network...

Terry

But of course you would not be allowed to talk handset to handset in
simplex mode without paying air time EVEN if no sites were available. The
phones would have to log the data:)

```
I'm looking to put together a simple tracker/gps combo that I can hook up to
my Kenwood V7A mobile rig. I don't have the money to blow on a nice D700A or
even the Alinco 135 unit. I'd like to get one of those little tracker kits
(like the TinyTrak) and find a compatible GPS unit that would work with it.
(without having to modify it like the Delorme units) I've looked around on
eBay and haven't found many deals on the GPS units. I don't need one with a
display for this purpose, just one that I can power externally and has a
computer output to hook up to a tracker kit. (an external antenna port would
be nifty too, but that's totally optional) I'm really trying to keep costs
under $100 if at all possible. Anyone have any thoughts/suggestions for me?
Heck, maybe one of you has an older tracker setup that you've recently
thrown in the shack due to an upgrade, let me know about it! Thanks to all.

I'd ignore the licensed SRI technology. Take a look at the state of the art in MANET (mobile ad-hoc networking). There is some extremely slick stuff going on there. I can't guarantee it will take over the world, but it has some real promise for infrastructureless networks at incident sites.

Most of the MANET work is pointed directly at military and emergency services agencies. It would seem to make sense for hams too.

THX/BDH

PS - I work on this stuff for the military...

Sounds like the New Rand McNally Streetfinder GPS For Laptop is just what you are looking for. Available on ebay for less than $100 or direct from Rand McNally for about $110.

I don't advise the V7a for APRS. It has an annoying tendency to interpret
speech out the speaker as DTMF tones through it's permanently open mic, and
act on them as commands, like reversing the sides, putting APRS on your
local repeater till you notice you haven't heard anyone in a couple of hours.

Also, the data side overrides the voice side, which cuts holes in what
you're saying.

The TNC requires that an entire packet, including checksum be received
without error. The TNC will output the decoded packet only after verifying
the integrity of the entire packet. Collision of 2 or more packets will
result in the loss of the data at the TNC.

The qAC,KG4JAC-2* portion of the header was added by the server to indicate
that the packet was gated by KG4JAC-2.

> course the pc and the Kam would have to be on speaking terms.

Dick Reichenbach suggested I use HyperTerminal to communicate with the
Kam. Firstly shut down WinAPRS, then rename EXITHF.TNC. Boot WINAPRS,
then exit. With no EXITHF.TNC file no parms will be changed thus leaving
the Kam in the APRS state. As a bonus it will shut down way faster. Set
up HyperTerminal to talk to the Kam. In my case, several trips to the
Help section were called for. Turn on the Capture Text feature and send
DISPLAY to the Kam, then turn off CAPTURE TEXT. Edit the file and save.

Thanks Dick

>(without having to modify it like the Delorme units)

Just an FYI - You don't necessarily have to modify the DeLorme units. I have an adapter cable that lets me run an unmodified one on a KPC3 and have a TinyTrak2 wired so that the Tripmate plugs right in.

Basically all you have to do is feed the data signal back to the GPS unit and supply DTR. There is a pin (9 I think) that feeds the center connector in the battery plug and you can use a jumper to get that to the positive side so that you can feed power to the unit also.

While many people have chosen to modify theirs both of mine (and a buddy's too) are used in stock configuration. I looked at it this way... I had to have an adapter to plug it into the KPC3 anyway so why not have one that fed the right signals into the line?

Bill

818. [aprssig] Mobile Mounting Question... (LONG)

From: Bill Herrmann <bherrman@spro.net>
Date: Tue, 25 Jun 2002 00:37:06 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86601-2002.06.25-02.14.23--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm looking to mount some mobile gear (mainly APRS, but probably a voice radio too) in a new to me sport utility vehicle. ('98 Isuzu Rodeo)

I've identified a couple possible locations, but have some concerns and am looking for some ideas from those who have been there and done that.

I've run a voice radio in the past on an under the seat mount that has worked fairly well. However, the front seats on this vehicle have some kind of air duct that likely supplies heat to the rear passengers. Doesn't seem like a good idea to heat the radios... (though I may be able to work around that by extending the duct)

There is a small "luggage" compartment built into the plastic trim in the rear. I'm pretty certain that most of it doesn't have much backing and there are not existing ways to get wires in/out of that area. It is, however, big enough that I could easily build a mounting board that would hold the radios and TNC.

On the other side there's a small access panel where the jack is stowed. There's enough room that I could mount radios to metal in there, but access to the radios would be fairly limited once they were mounted. I'm also concerned about the heat factor there as the radios would be at least close to the outer metal of the vehicle, which happens to be black... It is in a location where there is a vent so presumably some air must flow through there. (It appears to be the way that all the air put into the car by the HVAC gets out.)

I bought this particular vehicle so the kids could go along when Dad goes off road, so I need the radios to be firmly mounted. (AAMOF I had it off-road twice in the first week I owned it including one field expedition to run a temporary digi on a mountain peak.) Do I need to worry about any cushioning or is a solid mounting acceptable?

To sum up a little:
I can mount under either front seat, but I may have to deal with the air duct to keep from applying heat to the radio.

I can mount in the "luggage" compartment, but it doesn't have any current wire path and likely doesn't have much backing for the plastic. It also doesn't have any real air flow.

I can mount in the jacks compartment but may have a heat issue since the radios would be in the airspace outside the insulation and inside the outer sheet metal. (Note: I'd probably run a separate feed, but there is a 20A power outlet already here.)

Last, but not least... Antennas... I'd originally thought to just roof mount a pair of antennas. The trip up to our digi location has me wondering about that. There were several branches that would have eaten fixed antennas. I've not figured out all the details of the roof construction yet. Mounting antennas at the back edge seems fairly simple but probably isn't an ideal place.

Any thoughts, tips, links to web pages appreciated! (and feel free to just send 'em privately. I'll try to sum 'em up after the fact. - please indicate if you don't want to be quoted)

Bill - who is ready to have a permanently mounted solution!

p.s. Any tips on air bags appreciated too. Would just assume not set those off!

AFAIK, PCSat can only digipeat valid packets and does not do any decoding or conversion of submitted data packets.

I suspect that you may be seeing a defective conversion of Mic-E data that has been generated by an

IGATE.

Hi all,
Was there a movement afoot (sourceforge?) to document the APRS protocol of the Internet? (if so) How's it going?

Also...this is (can be) valuable information (the pathing, I mean), what was the reason for not keeping it intact when (if) RGated back to RF?

Ev, W2EV

http://www2.acc.af.mil/afrcc/

Is the Rescue Coordination Center web site for CONUS and near CONUS rescue efforts... of note is that on the web site is the information related to the Commerce Dept's ending the use of ELT's and EPIRB's on 121.5 and 243 MHz.

406MHz is the "new" (already been in use for a few years) distress beacon frequency... and integrated GPS encoded 406MHz beacons have finally dropped below $1000...

Just so it's clear... these beacons have a five year shelf life, can stay out in the weather (water/temp tolerant), and float... so before the standard ..... oh I could build one of these things for $17.23.... just remember the level of liability insurance risk these things carry since safety of life and million dollar ships come as part of the equation....

Hope this is informative and helpful...
And to be so bold as to quote a small part of the PJ Creed.... "These Things We Do, That Others May Live"

I just went thru the exact problem you are facing now....

I like what I have ended up with...

I bought one of the aluminum shelves which mount above the windshield...
tied all the equipment on top of it with plumber strap (hangar iron)..
Ran Power (#6) from the batt to an Anderson 30 amp plug (not the individual
power poles) so the shelf can be easily removed for maint.
I have 7 units mounted on the shelf... All wires run down the right door
post... The power runs across the shelf.. Each radio is attached
to the power feed thru the trailer type 2 conductor plugs.. Some are #10
plugs others are #16, based on the draw of the unit...

The whole installation has been easy and has exceeded all my desires... be
sure to mount units which need to be seen to operate
right over the Wheel....Turn other at an angle for ease of operating...
===
>. Antennas... I'd originally thought to just roof mount a pair of antennas.
>There were several branches that would have eaten fixed antennas.

I mounted the antennas on the roof rack in a way that if hit it will rotate
back and can be pulled back up...

Do like I did - tear out the center console, install two Gamber-Johnson
Mission Control series radio consoles, and run 1/0 gauge wire from the battery
to a (large) power distribution panel to run everything.

For antennas, drop the headliner and get out the hole saw... I've got 13 in
the roof of my Expedition.

Terry

Dave, could you embellish this a little more? I don't understand yet. For example, what do you mean by a "permanently open mic"? I have a V7A and I've not experienced this DTMF tone command problem.

I find the V7A to be a great rig for home APRS -- granted, my APRS beaconing rate/digi relays are minimal, so the voice cutouts on data transmissions are also minimal. But I would think the V7A would work OK for Stan, given that a D700 isn't available.

For that matter is there any option other than a D700 for simultaneous voice and data? For example, if he were to use a second radio in the car for APRS, wouldn't any transmissions from it desense the voice radio?

Thanks.

>I've not experienced this DTMF tone command problem.

The radio is controlled from the mic, by passing DTMF down the mic lead. That would be no problem, except that the mic element is always "hot" as well. So, if it hears anything in the ambient audio that sounds like DTMF, off you go.

It would have been simple to design the mic so that the mic element was out of circuit till the key is pressed, but that isn't how it is.

I ran mine with APRS on one side, and the local repeater on the other. I would find mine, about once a month or so either sending APRS to the repeater (side-swapped) or one or the other side would be on 440.

I finally modded the mic to de-activate the mic element when the key is not pressed, which solves that problem. The last straw for me is that the data side always overrides the voice side, and there is no way to change that.

So, now I have an FT-1500M dedicated to APRS.

He's also looking for low $, which the V7 doesn't really fit.

I don't find the desense objectionable.
If I'm not more than 15-20 miles from the repeater, it's not even
noticable. My antennas are about 6' apart. I'm using RS glassmounts on the
rear sidewindows for SSTV and APRS, and I have an SG-7900 in the front
center of the roof on the V7a. Works MUCH better :)

http://www.arrl.org/tis/info/pdf/0202038.pdf

says that the ej-43u digital voice module can be used instead of the ej-41 tnc module. This is slick stuff..... Now if we could just encode aprs posit into digital voice stream as a back channel....

Here's one more thing to ponder... the alinco 596 HT will do digital voice... since the mobile 135tp model will take the digital voice encoder (presumably they have the same form factor and plug), can we put the TNC module in the HT version?

Wes

Subject: [aprssig] Re: Question about trackers?

(Embedded image moved to file: pic20764.pcx)
You are absolutely incorrect in your conclusion that a telemetry station
does not require a control operator. It is clearly stated in BOLDFACE,
under 97.7 that each station must have a control operator.

A telemetry station may be operated under either direct or automated control. To comply with automated control, it must be able to respond
to interrogation from the control or auxiliary station.

As a control operator of ANY station, you must "ensure the immediate proper operation of the station, regardless of the type of control" (97.105) The "watchdog timer" as has been mentioned does not eleviate
the requirement of a control operator or satisfying the intent of automated control. Even for repeaters, they must include a 3-minute time-out function in the event of the failure of the control link, or the control operator's ability or desire to effect control.

Automatically controlled digital stations must be able to respond to interrogation from a control station that is being controlled either locally or remotely. The control station cannot be under automatic control. (97.221)

So, DUMB TRACKERS are illegal if not operated under direct (local) control because they cannot respond to interrogation from the control station. A control operator CANNOT EVER delegate his responsibilities
to an unlicensed individual. Giving a tracker to your unlicensed buddy
and telling him to "turn it off if I call you on the cell phone" is ILLEGAL. If you place a dumb tracker in a vehicle there had better be a

licensed Ham there to control it. If you place a tracker in a vehicle without a Ham, it must be secured to prevent unauthorized use, changing frequency, etc. Personally, I don't agree that it does not constitute 3-rd party traffic, but I'm not going to argue that any more.

One VERY IMPORTANT aspect of CFR's that few people recognize is the principal of "included" and "excluded" authority. Just because you are permitted to HAVE a telemetry transmitter in one part of the regs, does NOT give you blanket authority to ignore more restrictive, general requirements in another part. You can't ignore control operator responsibilities or the need for adequate control provisions by hiding under the guise of being a telemetry station. Some requirements are INCLUSIVE to all aspects of station operation; control is one of them, as well as the need to maintain adequate security of your equipment to prevent unauthorized transmissions.

And NO, I WILL NOT drop it, shut up or bury my head in the sand when someone asks an innocent and relevant question. You do what you want with your license, ignore the requirements of station control or security, I don't care. But I won't tell someone its fine when it isn't.

It is fully legal under 97.221(b):

(b) A station may be automatically controlled while transmitting a RTTY or data emission on the 6 m or shorter wavelength bands, and on the 28.120-28.189 MHz....

An APRS tracker is an automatically controlled telemetry station, therefore allowed to transmit one-way transmissions, and free of the need for a control operator. The "devices and procedures for control of a station when it is transmitting so that compliance with the FCC Rules" are provided by the software in the tracker itself. It islegal to put it in a balloon, in a car driven by your wife, non-hams, and just about anything else (as long as it isn't the normal course of your own business).

APRS has been around for nearly 10 years, running stand alone trackers without control ops for almost as long. It is one of the biggest activities in ham radio, and the FCC is most certainly aware of it. If they had a problem with any aspect of APRS we would have heard about it by now.

Can we put this to rest again (at least for 6 months until it certainly will pop up again, as it has so many times in the past), please???

They are supporting an emergency (fire), keeping traffic down, not placing a HAM (presumably not a fire-fighter) on an emergency vehicle in harms way, etc., etc., etc.   It is a situation where it is far easier to seek forgiveness (if questioned) than permission. If it makes sense, do it!

Now, tracking a balloon as a hobby/science project would be in a different category altogether.

---------Dave's Original message--------
Hello all,
I mentioned to an ARES member that it would be nice to have some
trackers
so that they could be attached to vehicles that we wanted to track
and
free
up a ham. We are currently supporting the Hayman fire. About 70% of

the
net
time is finding out the current location of this person or this
vehicle.
   His question is this legal? How is the best way to respond to him
on
this?

Thanks & 73,
Dave N0EOP

Doesn't the tracker have the ability to send canned messages?

The last thing you would want in that scenario would be an untrained
(non fire fighter) passenger.

I'm looking to set up such a system for ground/air search and rescue and
I'm sure Bob said that the Tiny Trak II could send one of seven canned
messages by the turn of a switch.

Yeh, but since the ham is already there. You'd proably wanna
leave him/her there in case of an emergency (for example, they get
cut off
by the fire) so he/she (not the pervert kind)
could get back on the air and keep the CP advised.

(lyris just sent me a 14k message that included my original post, saying
wouldn't let me post a message that was over 10k and indicating my message
was 11k over the limit...  welcome to the New Math)

I'm no lawyer, and am certainly not versed in the interpretation of FCC
legalese, so please forgive me if the following isn't really applicable,
but, in the instance originally sited here, specifically -- communications
in support of forest fire fighting efforts, doesn't the following section
of part 97 apply?

97.403 Safety of life and protection of property.

No provision of these rules prevents the use by an amateur station of any
means of radiocommunication at its disposal to provide essential
communication needs in connection with the immediate safety of human life
and immediate protection of property when normal communication systems are
not available.
----

Personally, and this should be considered just my opinion, I think that its
pretty clear -- putting an APRS tracker into a firetruck which is going to
be going out to into the wilds seems to me to satisfy all of the above
points:

- Tracking/locating firefighters is an essencial communications need

- It is being done in connection with immediate protection of life and
property

- Other communications systems (specifically for tracking and locating)
aren't available due to either shortages of manpower or shortages of
equipment.

```

If you're after cheap (not necessarily simple), then go with a
TinyTrak-II kit, a Trimble SV6 GPS board w/external amplified
antenna, and put a transistor inverter (1 transistor and 2
resistors) between the Trimble's serial out and the TinyTrak-II's
GPS input. If you add a lithium coin cell to the correct line on
the Trimble it'll remember the almanac and come up transmitting data
more quickly. Otherwise it'll take 15 minutes or so to download it
each time you turn it on.

You need to get one of the SV6's that can be switched to NMEA mode.
Some of them can be switched between TSIP, TAIP, and NMEA. I have a
couple of these.

Now, after having said all that, the DeLorme mod doesn't sound as
bad, does it?

In my case I'm after a very tiny package for hiking, so the Trimble
is a good fit for the price. I'd actually rather have a GPS-35 for
this purpose, but they're a lot more money. They'll work through
the trees better though.

There were two options presented to us when we were considering
adding igate injection ID to Xastir. This was not one of them. We
now do injection ID like this: "KG4JAC-2,I". The other option was
to add a '0' in front of the SSID. I guess some APRS packages do it
one way, some the other.

Which software package is igating it as "qAC,KG4JAC-2*"? So now
there are three methods of injection ID?

> What is in use to power a GPS for a tracker station?
> Can a 7805 or 06 handle it?

Typically yes. I bumped up the regulator on a TinyTrak-II to a 7805 or LM340T-5 and use it to power the TinyTrak-II and a Trimble SV6 board w/amplified antenna.

Usually a GPS will take 150mA or less. Not much of a load for a 7805, especially if it has at least a miniscule heatsink.

What kind of GPS? You might want to throw in an LM317T so you can set the voltage for your particular GPS. Some of the Garmins like to have 8V or higher. Some of them will blow up at that voltage.

The TinyTrak II can be easily configured to send out one of two different messages at the turn of a switch (selecting one of two whole different configurations, actually). There's no easy way to get more than two, that I know of.

No, that would be the Mic-Encoder from TAPR that can do that.  It
has a rotary switch for setting one of the 7 Mic-E messages.

The TinyTrak-II can switch between only two modes with an external
switch.  You could put set it for an emergency message on one side
and select it with a toggle switch.  You can program in one of the
canned Mic-E messages and/or add your own message in the comment
field.  You need a computer to do this programming, so out in the
field all you can do is hit that switch to transmit the
pre-programmed settings.

You can also switch between 7 different messages in the Kenwood
TH-D7A or TM-D700A.  They are the 7 canned messages that are in the
Mic-E protocol.

Curt Mills, WE7U                         hacker.NO_*SPAM@tc.fluke.com

You could configure the system with more than 1 TT-II and use a multipole
rotary switch (a 6-position 2-pole rotary is commonly available evan at
Radio Shack) to select the 1st TT for messages 1 and 2, the second for msgs 3
and 4, etc.

Wire the PTT lines, audio out and mode 1/2 lines of all the TTs in parallel.
Then
use 1 pole of the rotary switch to route power to the appropriate TT, and a
second pole to ground/not ground the mode1/mode2 line.   Even with two or
three TTs involved, it would be cheaper than a MIM encoder.

844. [aprssig] The qAC path element (was NOCALL in Brevard)

From: Dale Heatherington <dale@wa4dsy.net>
Date: Tue, 25 Jun 2002 13:52:01 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86659-2002.06.25-13.29.35--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There is only one single aprs server doing the qAC thing.
It's an experimental version of aprsd215 at the wa4dsy
lab. It has not even been released as a beta.
The whole concept of adding information about the
packet source is still under discussion. No final
decision has been reached. But, yes, it should be done
one way, system wide.

About the qA.. construct:

The construct is a header field indicating the rest of the
path is not RF but Internet related. It serves as a seperator
between the RF part and the Internet part. Since several
characters are available they can add information about the
packet and data.

q is a unique character not ever present in a TNC path from RF.
A is the protocol of the data payload, in this case A=APRS.
The 3rd character indicates the local source of the packet as follows:

C validated logged on Client user that didn't add his own q
X un-validated client
R from RF (TNC)
I Internal
S Internet aprs server (old one that didn't put in it's own q)
U the UDP port on aprsd
Z Zero hops. Do not repeat this packet. (::USERLIST etc should set this)
3 3rd party packet converted to normal that has never been Igated TO RF.

Note: The last one "3" is a hack and needs a different solution.

Following the qA path element is the callsign of the station
the packet was received from. If it came from another hub or server
the servers alias is used. The alias is created from the first 6
characters of the domain name plus the 12 bit CRC of the complete
domain name in HEX. These aliases can be seen on the wa4dsy.net
14501 status page. http://wa4dsy.net:14501

This version will continue to add callsigns after the q element
allowing full tracing of the Internet path. In additon it will
check for duplicates in the Internet path trace. If a dup is found
the packet is rejected as a "looped packet". The Internet
trace/loop detector is Steve Dimse's proposal. Other means
of loop prevention are possible (time-to-live counter, existing dup detector).
Less than complete tracing is possible (first station only).
It's still not nailed down.

Also, if a packet is received with the UI-View "callsign,I" construct
present aprsd will replace it the the qA.. construct.

Hopefully this will clear up any confusion about the weird little
qAC thing present in some packets.

I just added to the PCsat page a plot of the last 16 hours of battery
voltages.  It shows the deep discharge during nightime passes over South
Africa after afternoon passes over USA while GPS was on.  Also one station
was beaconing every 5 seconds over the USA, resulting in almost loosing
the power budget.

As we enter into eclipse again, users are encouraged to USE PCsat, but
please do not abuse her.  Once she drops below threshold and resets, then
we cannot get her back out until August.

de WB4APR@amsat.org, Bob

I owned a V7A for a while...
It worked quite well, but as mentioned, it
had a quirk; of a different nature:
It would LOCK UP XMIT when you
UP/Downloaded the entire memory contents
either way.
After shutting the radio OFF for a minute, and a
REstart on the computer/laptop, all would be well.
```

Sorry, while trying to get the "I" construct added to APRSd, Dale began
many discussions with a number of people and we wanted to expand the "I"
to add additional data, such as the source of the packet, the type, the
Country, its age, and other such data.  And the "I" was suggested to be a
Q which has NO conflict with any ITU callsigns..  He is experimenting witht
this construct before proposing this to the APRS spec list...

Bob, WB4APR

```
I have given up trying to serve as an Igate for PCSAT for the simple
reason that I have been unable to determine in APRS+ if I am actually
gating.

I have tried several methods to log the data but it does not show which
packets are sent where.  I also have not heard anything from PCSAT on the
last several passes.  I am using an ALINCO DR-135 to a 1/4 wave ground
plane at 20 feet with 25 feet of coax.

The system works repeaters out to 30 miles with good copy and simplex to
10-15 miles base to mobile.  It should be hearing the PCSAT but does not
seem to be doing so.  I will monitor with Alogger until I see some activity.

I am listening 145.825 as Bob requested.

Today I just did a 16 hour capture and it was on all around the world and
I just turned on the PCsat GPS and got over 12K of downlink data from it.
This was on the 2014z pass on 25 Jun over the east coast.  You will get 3
more passes this evening...

> The system works repeaters out to 30 miles with good copy and simplex to

Should work, but every dB counts.  (Of course I am using an 8 element
Beam, but the signals on 144.39 downlink are strong enough to even get
in over the top of dx QRM on there...).  Sigs on 145.825 should be just as
strong...

Good luck

Bob

For what it is worth, I will be commanding HIGH rate telemetry from PCsat
on the 2155z pass this afternoon to try to get some Spin Rate data.
THere will be packets every 10 seconds on 145.828.  I tune to 145.830 at
start of pass and 145.825 at end for best reception...

This is an overhead pass coming up the east coast.  If you are out
west, you wont see it though..
```

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org
Message-ID: <LYR842-86727-2002.06.25-19.26.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat uses black and white painted antennas around its middle to provide some spin torque due to differential radiation pressure. Last time we measured it in March, the spin had slowed and stabalized to about 0.6 RPM. We assumed this decay to steady state was due to losing any initial spin from separation.

Today (at the end of a 2 week full sun period) we measured it again and it was up to 0.8 RPM, almost 30% faster. Now it is obvious that PCsat spins up when it is in full sun and slows down as it goes through less sun periods of maximum eclipse..

So the radiometer effect does work very well.

Rendered body type: text/plain

It is all in how the enforcement agency interprets it's own regulations IF it finds it neccessary to initiate enforcement. In the scenario provided the "immediate" requirement is not really met and it's definitely isn't an issue of "alternate means" not being available because, clearly there are. As I commented in my post to the list; in times of normal activity I wouldn't place a tracker in a vehicle where I would have little control but, wouldn't haven't any hesitation of doing so in this scenario.--73

Rendered body type: text/plain

```
Earlier this year I spoke with Riley Hollingsworth about Part 97. His
comment was one that I continue to repeat today whenever someone asks about
our tracking hobby. He said, "Many amateurs try to read more than what is
there. Don't get caught up in the rules so much that it keeps you from
having fun. Our hobby is about having education and having fun. All you have
to do is be responsible, follow a few simple rules, and anyway, if you do
something wrong, someone will let you know."

Now guys, I don't know about you, but that is exactly what I have been and
will continue to do, have fun with this hobby. If you want to debate it down
to the last word, then go ahead, but do it somewhere else. It really doesn't
matter what you say, I am going to have fun with or without you.
```

I want to pass on another comment from Mr. Hollingsworth. I am paraphrasing here, he said we need to stop all the "in-fighting" in our clubs, on the internet and especially on the air! He said that there are many people in other countries who monitor our bands and record our actions. "It is very difficult for us to make our case for Amateur Radio at the WRC when someone comes up and plays a recording of what you heard on 75/80 meters a few years ago."

I can only tell you guys that all this bickering on this SIG is very harmful to our segment of the hobby. I have received numerous complaints from new hams I have pointed to the SIG for information to the point that I NO LONGER RECOMMEND THE APRS SIG TO NEW USERS! This is most unfortunate, as I have been a member and supporter of this SIG for many years. I also teach ham radio classes, graduating more than 100 new hams each year, and have been promoting APRS and this SIG. However, this SIG will no longer be recommended until it is cleaned up.

I want to make a challenge to you folks out there, to take this SIG back to what is was. A place where new users can ask a question we have all heard a thousand times and get a helpful answer. I was amazed to see a new APRS users ask a few weeks ago a simple setup question and was totally ignored! Except for one of you who replied, "go to the website and search the archives!" What would my students do if every time they asked a question I answered with, "go look in the book, I'm too busy to answer you!" I can tell you that I wouldn't have a class very long!

Guys, lets get out of this rut on this SIG and make it what is should be. A place that is helpful to new users and a place to share new ideas!

Finally, I want to give you a heads up on an article I wrote for QST and CQ magazine about APRS and SAR. I think it is to be published in the August issues. I believe we have only started to scratch the surface with applications for APRS and hope that you will join me in making it a fun and enjoyable part of our hobby!

Well done and thank you!

I wanted to be a part of this 'exclusive' club for over thirty years. Now that I am one, I sometimes wonder if it was worth it considering all the infighting, locally and especially on this SIG. It amazes me how folks who are supposed to be communications experts miss the point of others, and are so willing to impress their opinion on others that they do not 'hear' what another has said. It truely gives me pause.

Thanks Scott,

Vince

Is anyone else getting virus-laden email from this guy?  I have been
trying to contact him as he has apparently made NUMEROUS attempts to
unsubscribe me from the APRS SIG over the past month.

QRZ lookup lists him as James Frazer in Pennsylvania but upon calling
directory assistance for that area no listings were found in the region
matching his name or address.

I run a V7 for voice and a D-700 dedicated to APRS. I haven't noticed any
interference between the two. The V-7 is hooked up to a dual band antenna on
the left front fender. The D-700 is connected to a Hustler 5//8 center load
whip behind the cab on the left side of the pickup bed. (This is on 97 F150
Super cab 4x4)

I found my GPS unit in a local pawn shop, a Garmin EMap for $90.
Don't overlook this as a source for GPS from people who had to get quick
cash and decided they didn't need them that bad.

Subject: [aprssig] Cheap tracker ideas?

I'm looking to put together a simple tracker/gps combo that I can hook up to
my Kenwood V7A mobile rig. I don't have the money to blow on a nice D700A or
even the Alinco 135 unit. I'd like to get one of those little tracker kits
(like the TinyTrak) and find a compatible GPS unit that would work with it.
(without having to modify it like the Delorme units) I've looked around on
eBay and haven't found many deals on the GPS units. I don't need one with a
display for this purpose, just one that I can power externally and has a
computer output to hook up to a tracker kit. (an external antenna port would
be nifty too, but that's totally optional) I'm really trying to keep costs
under $100 if at all possible. Anyone have any thoughts/suggestions for me?
Heck, maybe one of you has an older tracker setup that you've recently
thrown in the shack due to an upgrade, let me know about it! Thanks to all.

863. [aprssig] NOSaprs 1.14b (BETA) - APRS client connections revisited

From: Maiko Langelaar <maiko@langelaar.net>
Date: Tue, 25 Jun 2002 20:32:48 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86763-2002.06.25-23.10.15--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

This is for those using or wanting to use their TNOS
or JNOS systems to support APRS activity in their area.

If anyone is interested, there is a new NOSaprs patch
available for people to play with. In this BETA release
I have once again made available support for APRS client
connections on port 14825. This port allows clients to
send APRS information to the APRS IS without getting the
big firehose of data back at them. Ideal for monitor only
stations or weather stations or those clients that have
very low speed/bandwith connections and are not interested
in 3rd party messaging, etc.

The patch and corresponding update notes are at this URL :

http://www.qsl.net/ve4klm/packet/aprss.html

Please read the upgrade notes that accompany this patch,
since they contain very important information on changes
made to the aprs command set and your autoexec.nos entries.

Best regards,

Maiko Langelaar / VE4KLM

My radio has 0.11 uV sensitivity at 10 dB S/N

Does this mean that to acheive a ratio of 10 db Signal to noise requires 0.11uV or better ?

I can't see why they say 0.11 uV or LESS

Therefore a "lower signal required" = better receiver?

RF Engineers ?

```
I just went there this week-end to start my motorcycle cross country from
Key West to Homer, Alaska.  APRS worked fine there.
I used path of  wide,wide.  No relay.

I'll be heading out on Friday to continue to Alaska.
http://rwrockwell.com

Have fun in Key west.  Wish I could have stayed longer.

73
Roger

They mean that if you measure several different copies of the same receiver,
you will find the worst case will be .11uV but that MOST (but not all) will
be even better -  .10uV , .09uV , etc for the same 10dB S/N.

Rendered body type: text/plain

More specifically if you have .11uV signal, the receiver will display 10db Sinad (which is weighted to specifi specs) on a Sinad meter connected to the audio chain. A Sinad meter measures signal to noise ratio yes....

The or less part means some specimens will exhibit 10db Sinad at lower signal levels than that, but .11uV will be worst case sensitivity for any properly tune factory specimen...ang that is a guaranteed better than spec...

```
I forgot to address the second part... Sensitivity is only half the
equation, if your receiver and the transmitter are the ONLY ones on the air
on any freq adjacent, then yes it is most important, however sensitivity is
balanced with selectivity which is the ability to ignore off freq signals
which you do not need to hear..
         As you amplify the front end of the receiver which improves
sensitivity, selectivity degrades as all components have overload figures
which can eventually, with too much interference or overload, negate the
gains of any additional amplifiers ( which is what improves sensitivity )
         In general all the components in a receiver which make it
selective, reduce the sensitivity of the receiver at the same time, so
amplifiers are added in the chain to recover losses induced by these
components. Amplifiers can only recover losses in components after them, so
any filtering components in front of them are losses.. period...But the
closer the amplifiers are to the antenna jack, the more likely selectivity
issues will get worse as overload and noise in general will rise along with
the good signal..

         So all receivers are a tradeoff of these things, so as to be able
to live in the RF environment of our imperfect situation...

No, that would be the Mic-Encoder from TAPR that can do that.  It
has a rotary switch for setting one of the 7 Mic-E messages.

The TinyTrak-II can switch between only two modes with an external
switch.  You could put set it for an emergency message on one side
and select it with a toggle switch.  You can program in one of the
canned Mic-E messages and/or add your own message in the comment
field.  You need a computer to do this programming, so out in the
field all you can do is hit that switch to transmit the
pre-programmed settings.

You can also switch between 7 different messages in the Kenwood
TH-D7A or TM-D700A.  They are the 7 canned messages that are in the
Mic-E protocol.

Not only yes, but APRS exsits everywhere on the planet at least 12 times a
day for a few minutes as either PCsat or the ISS comes over.  A friend is
using his D7 and a full size whip to send Email while he is offshore on
his sailboat...

What you see below is being sent on every post you make...
I took a look at it, and it appears to be the little icon that specifies
an attachment...

Do you have OE configured to send a 'tag line'?

```
OK,  it is a 2.6 kb file, an icon of a sheet of paper with the corner
turned down labelled "attachment",  DOIM is working on the problem.

   Don't know, being appended by Outlook, not by me, DOIM is looking
   into
   it, think it is an icon, how big is it?  My "sent file" copies have
   nothing appended.

```
I was there 4 weeks ago for a week. My path was
RELAY,WIDE,WIDE and I was on FINDU most of the time.

Why are we having to discuss NO RELAY again and again? RELAY
should be honored everywhere a mobile can go, period. All
WIDES should, and ALL home stations should honor RELAY
unless too many neighbors are already operating as RELAY,
for the soul purpose of getting mobiles to the first WIDE.

We in the Chicagoland area do this and every traveler coming
through gets seen and I-Gated so his hometown friends and
relatives can track his progress... RELAYs can be managed
just like WIDEs can, right?

My 2 cents again, :-)

Robbie

877. [aprssig] PCsat Load test

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 26 Jun 2002 10:41:29 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86792-2002.06.26-10.18.59--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat USER INVITATION:

Since we blew it for fieldday (low bats), PCsat has just never gotten a
full user load to prove its ability to support hundreds of users per
pass.   Before it goes back into maximum ecllipses, I would like to
load it with as MANY different users as we can. Target is TOMORRW.

THURSDAY AFTERNOON, GOING HOME RUSH HOUR, USA, 27 JUNE 2002

If you normally run APRS mobile with a path beginning with RELAY or WIDE,
all you have to do is QSY to 145.825 tomorrow afternoon. PCsat is just
like any other APRS terrestrial RELAY or WIDE digipeater. Keep your rate
set to once every TWO minutes or so. Do not force more frequent
transmissions... thanks.

PASS TIMES THURSDAY AFTERNOON RUSH HOUR 27 June 2002

PDT	MDT	CDT	EDT
....	....	....	1525 (northeast only)
....	....	1605	1705
1545	1645	1745	1845
1730	1830	1930	....
1910	1810	....	....

Please do NOT transmit more often than once a minute or so, so that we can
see the statistics of the most number of people, not the most number of
packets... Here are the settings if you are setting up from scratch:

UPLINK/DOWNLINK: 145.825 MHz FM packet 1200 baud AFSK
DIGIPEATER PATH: via RELAY or WIDE or ARISS or W3ADO-1
PACKET PERIOD: On the order of 2 minutes or so

Note, the DEFAULT alias for PCsat is W3ADO-1 which will always work. In
order for RELAY and WIDE to work, the satellite has to be loaded with the
additional aliases. THey WILL be loaded, unless Murphy strikes...

Please set up your tracker or mobile or base station and join us. We want
to do this test to see the maximum number of stations we can support for
the sake of validating the design for the future.

Also feel free to load ONE Email or APRS message and set it to the 1
minute rate as well if you have time... (do not force transmissions any
more often)..

IGATES: Recently, we don't see as many IGates set up for feeding PCsat
packets into the APRS internet system which drives http://pcsat.aprs.org
and so we would ask IGate operators to be sure to have your receiver
tuned to 145.825 for Thursday afternoon... if you can... Thanks

de WB4APR@amsat.org, Bob

878. [aprssig] Re: APRS in Key West?

From: Chris Schwab <1schwab1@tampabay.rr.com>
Date: Wed, 26 Jun 2002 10:44:25 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86793-2002.06.26-10.24.09--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

All:

I was down there a few weeks ago myself, and had a conversation with K4HG
about the digi's down there.

To paraphrase the converstation:
The network was originally set up to serve the Monroe County EOC with
weather data from the Keys weather stations. There was not/still is not many
other APRS stations in the keys, so the trustee of the WX stations is not
interested in making changes. For a while, the WX stations were not even on
the same frequency, and according to Steve, it basically took an act of
congress to get the stations moved to 144.39.

Your best bet: Set your station to Wide,Wide once you are south of Florida
City (the last city on the Turnpike). You'll have coverage up & down most of
the keys.

73!
Chris N4BSA

While checking out the stations along US 1 along the keys, I
noticed a callsign descreptiency with one of those WX
stations Steve was talking about on the subject of RELAYs.

It has W71UC-6, the number one instead of the letter I..
Maybe while he is fixing that, he can also fix it to honor
RELAYs, :-)

Robbie, wa9inf

Amateur Radio phone transmitions are a broadcast media. Some people in this
hobby are broadcasters (a oneway media) and so, this is what they do. They
say a lot, listen little (if any) and learn nothing more. Others in the hobby
are listeners, and receive what they hear without much response. Still others
are two way messengers that give and take freely the information that they
have access to.

The broadcasters are the most annoying and the listeners are the ones we have
the most to learn from (they have heard it all). The two-way messengers hold
the latter two groups in each hand and provide all this profound
interpretation of what they perceive.

We need all of these people. We just have to learn to live with them and
understand their mental bias toward a particular mode of participation. And
that participation may change over time based on the feedback we give them!

Thinking about the surplus SVeeSix-CM3 GPS receiver?

Documentation, an interface schematic and Trimble
software links are provided for the surplus SVeeSix-CM3
GPS receivers currently available from B.G. Micro.

The document is in Adobe Acrobat format and is useful
for reading or study before purchase. Seems to be a
well written document.

Rendered body type: text/plain

```
The NEMA protocol is supported in this receiver.  Receiver must be
programmed
 with the software from the Trimble web site (ftp).  This is covered in the
PDF link below.

A TTL to Serial Interface must also be built (also in PDF) to access and use
the receiver.

Rendered body type: text/plain

```
Hi Folks,

 I am hoping to find out any information about the Alinco DR-135TP, ETrex
and the pocket APRS.

 I have tried to get this combination to work but have not had any success
as of yet. It seems the Radio will stop sending data after a while to the
palm. Almost like the software flow control is not working correctly.

 I am yet to get the radio to see the Etrex. I even open the cover and
looked at the leds as per the tnc manual and it does not seem to be getting
any data from the Etrex.

 Anyhow, I use both the Palm and the etrex with my d7a and it work
flawlessly.

 Any help with parameters or setting would be appreciated. I also read
somewhere that the tnc's in the Alinco tend to lose their memory. Is there
any truth to this??

 Angelo

890. [aprssig] smart beacon kenwood sucess!

From: "Wes Johnston" <wes@johnston.net>
Date: Wed, 26 Jun 2002 22:35:55 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-86863-2002.06.26-22.13.40--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Yay!! first live test tonight.... I got smart beaconing to work on my
kenwood d700!!  Rode around the block and it pegged all the corners!  There
was a delay on one of the corners due to CDMA, but the kenwood was ready to
TX as soon as the channel cleared.

I've bought a 3/32" stereo extension cord for a cellphone from rat shack,
hacked it in two to get a male and female plug to insert in line with the
d700 GPS.  In this way, the Basic stamp and the kenwood both see the GPS
output and the kenwood is still able to upload waypoints to the GPS.  I then
wired one of the basic stamp outputs to pin 3 on the  kenwood so I could
send commands like BCN 0 and PS 1.  I've also included pin 8 on the serial
port of the kenwood as an on off indicator so that in the future I could
power the radio on and off via software.  I have been able to manually
switch it on and off via software, just need to tweek the smart beacon
program to add the timer for it to be fully automatic.

I tried this with pic basic pro on a 16f84 at various clock speeds from 4mhz
to 20mhz with no luck reading the GPS reliably.  Although the pic is
cheaper, PBP's compiler is just not able to produce effecient enough code to
read the continuous stream of data from the GPS.  Perhaps a '876 with a
hardware USART will be in the future version - because it's cheaper than a
stamp.  I have found a company which makes a thru-hole parallax licensed
basic stamp2 for $31 and the stamp2sx for $39 ($20 cheaper than parallax).
http://www.hvwtech.com/stampstack.htm .  Soooo.... you can add smart
beaconing to your kenwood radio for the price of a $31 basic stamp2.  The
interface to the gps and kenwood so far has required one resistor in
addition to the basic stamp 2.

In a few more days I'll tweak some more and post a schematic and source
code.

Wes

You need to select NMEA 6 under the APRS / GPS WAYPOINT menu.  The gps I use is
a garmin 162 and it allows me to display the entire callsign (9 characters),
but yours will let you show only the last 6 letters in the callsign.  For
example, kd4rdb-14 would show on your GPS screen as RDB-14 .  Also, make sure
your GPS comm port is set to NMEA in/out.

New addition.  In calculating Near stations, you can in addition to entering a callsign, enter a
Latitude/Longitude, or a Grid Square.
So enter either a Callsign, Lat/Long, or Grid Square, select the appropriate radio button, then click
the Near button.  When entering Lat/Long,  first enter the Latitude,  then a "/" without quotes, then
the Longitude.  The program recognizes a number of different Lat/Long representations, in either Decimal
 Degrees,  Degrees, Decimal Minutes, or Degrees, Minutes, Decimal Seconds.  You can either use a "S" or
"-" for South Latitude, and "W" or "-" for West Longitude.  The following are all the same:
N34 2.389 / W117 14.465
```

34.03981 / -117.2410833
34.03981 / W117.2410833
For the Grid Square at the same location:
DM14JA
or DM14JA19BN

Subject: [aprssig] Web page updated

Updated web server showing position, status and callsign. See http://kh2z.lynxstudio.com. Callsign entry for find "Near" stations requires the exact callsign and is case dependant. If you are looking for WB4APR-9, don't enter wb4apr-9.   Data and Map calculations are not case dependant, and a partial match will be returned. You can enter multiple callsigns, separated by either a comma or a space if desired. This is just a little experiment and the web page may disappear or change at any moment. Feedback would be appreciated. Brent KH2Z

>his sailboat..

I've always viewed the birds only as "for fun" or "last resort" as they relate to APRS. Earthbound digis should be the preferred way to go, I would think -- if they exist, they're better.

A guy on a bike and probably most drivers/pilots are going to want to set their path and their frequencies and leave them. They're not going to want to fool around with changing them while driving. Plus they're hoping for better coverage than 12 times a few minutes per day. For the guy on his boat without much chance of hitting a digi, the birds make more sense; or for a guy on a bike who is now in the Alaskan wilderness.

I'm assuming Bob is advocating the birds for the latter situation... not for normal running and not for switching back and forth (land/satellite) -- who would you know when a *working* bird is overhead? (OK, OK -- I know the converse argument is how do you know when your land-based digi coverage has stopped?)

I'm mostly playing devil's advocate here -- hoping to get a appraisal for someone new to APRS wondering what's realistic as far as travelling and satellite operations. What would you do? :-)

73,

Ralph KC2RLM

Easy, if you are in range of 144.39, and someone is running APRSdata in your state, then your APRS system (or kenwood radio) will display an OBJECT of any satellite currently in view. Or go to the DX list and see the schedule for the next 80 minutes.

See http://www.ew.usna.edu/~bruninga/satinfo.html

But when you are not in the terrestrial system:

PCsat comes over about the same time every day and you will get 2 or 3 passes during one period and then 2 or 3 more at a different time depending on your Latitude. But the neat thing is that for your current location, once you hear a pass, PCsat will come over exactly 30 minutes earlier every day, plus ADD 100 miuntes every week. ANd since you can hear it when it does, just leave your radio on that freq so you will be aware of the timing...

So, it is easy to do, and only for fun if you already have 144.39 coverage, but is the only way to get out if you dont... assuming y ou dont have HF either... I will post the currrent approximate pass times in the next message...

>I'm assuming Bob is advocating the birds for the latter situation... not
>for normal running and not for switching back and forth (land/satellite) --
>who would you know when a *working* bird is overhead?

I have a server at work that sucks pages off of heavens-above.com and sends me text messages on my cell phone with the information about PCSAT and ISS passes. It sends them the hour before they occur and the of the pass. This is good for working the birds on their next pass, but not good for planning, ahead of time, when to work the birds. And, if I have no cell coverage, I get no messages...

Thinking about the surplus SVeeSix-CM3 GPS receiver?

Documentation, an interface schematic and Trimble software links are provided for the surplus SVeeSix-CM3 GPS receivers currently available from B.G. Micro.

The document is in Adobe Acrobat format and is useful for reading or study before purchase. Seems to be a well written document.

Rendered body type: text/plain

I have often thought of using this system while solo canoeing on week or multi-week long trips. When I do this I plan to print a list of pass times for whatever Sats are available. With a list of pass times I just turn on the system 10 minutes before the pass. I hope to do some more canoeing after I get out of school in a year. Summer is not a fun time to canoe the Okefenokee swamp. To get a printout of the upcoming sat passes is child's play for most satellite tracking programs. I usually pull one from STSPlus once a week and print it.

For sats that only decay very slowly like PCSAT it works great. For sats that can maneuver it is less precise but can still work if you keep the KEPS updated. I see no reason that ISS and future APRS sats can't provide a "set and forget route" into the APRS Internet system for travelers. The key is to use a common frequency and path. However the need to avoid the sats hearing each other could be a problem but callsign substitution could handle this.

Two or three sats could provide long distance travelers the ability to update their position within a few hours resolution that can be refined when they reach populated areas by switching to terrestrial digis. This is simplicity itself in the Alinco or any tracker that uses a programmable radio. Just change channels to the correct frequency.

Obviously these clones should build on the lessons of PCSAT and try to shoot for more battery capacity and better solar panels to avoid some of the problems. PCSAT has more than amply demonstrated the concept now it is time for the APRS and AMSATcommunities to get this done. I personally would like to several clones of PCSAT built and launched by AMSAT as soon as practical. This would be more than enough to convince me to join AMSAT.

I think it would be neat to have another APRS satellite that is geosyncronous (sorry for the spelling) that would hover over North America and near-by waters. This would give better SATCOM coverage here in the USA. Of course getting a few of these birds up there that would cover Europe and South America and Africa along with the waters in between would be really neat! Talk about a worldwide APRS coverage area 24/7!

Subject: [aprssig] Sat passes and sat utility

I have often thought of using this system while solo canoeing on week
or
multi-week long trips. When I do this I plan to print a list of pass
times
for whatever Sats are available. With a list of pass times I just
turn on
the system 10 minutes before the pass. I hope to do some more
canoeing
after I get out of school in a year. Summer is not a fun time to
canoe the
Okefenokee swamp. To get a printout of the upcoming sat passes is
child's
play for most satellite tracking programs. I usually pull one from
STSPlus
once a week and print it.

For sats that only decay very slowly like PCSAT it works great. For
sats
that can maneuver it is less precise but can still work if you keep
the
KEPS updated. I see no reason that ISS and future APRS sats can't
provide
a "set and forget route" into the APRS Internet system for travelers.
The
key is to use a common frequency and path. However the need to avoid
the
sats hearing each other could be a problem but callsign substitution
could
handle this.

Two or three sats could provide long distance travelers the ability
to
update their position within a few hours resolution that can be
refined
when they reach populated areas by switching to terrestrial digis.
This is
simplicity itself in the Alinco or any tracker that uses a
programmable
radio. Just change channels to the correct frequency.

Obviously these clones should build on the lessons of PCSAT and try
to
shoot for more battery capacity and better solar panels to avoid some
of
the problems. PCSAT has more than amply demonstrated the concept now
it is
time for the APRS and AMSATcommunities to get this done. I personally
would
like to several clones of PCSAT built and launched by AMSAT as soon
as
practical. This would be more than enough to convince me to join
AMSAT.

Actually, we had a launch and a design for one. But one week before
integration, we got scrubbed due to State Department Bureaucracy.

The neat thing about its design is that it would have accepted USER
uplinks from the USA on 144.39! So people in North america that wanted to
be tracked either terrestrially or via satellite did not have to make ANY
changes... except for one....

Since the satellite would be at 22,000 miles up instead of 500, it would
take LOTS more power to hit it. But a mobile with a 19" whip would have
made it with a 170W amp....

One minor point here: It would have to be a geostationary satellite
(over the equator) to be able to stay over one spot on the earth.
The mini-dishes and BUD (bug ugly dishes) that people use for
satellite TV are pointed at geostationary sats. That way the
antennas don't have to move, once set. These sats are WAAAYY up
there, making the path loss considerable.

Geosynchronous sats are much lower altitude sats that whiz by like
the GPS sats (11 hours 55 mins per orbit still for GPS?). GPS sats
are in three different 55 degree inclined orbits if I remember
correctly, and each pass occurs over a different path as the earth
rotates underneath them.

Well, since we would know the position of the satellite (as long as
there was enough station-keeping fuel left) and we know the position
and the course for our vehicles, I can imagine people running
computer-controlled beams that would remain pointed at the satellite
as you drove along, thereby reducing the power requirements needed
to hit it considerably.

I respectfully disagree with the idea of a geosynchronous satellite for the simple reason that it requires far to much power for remote users. The battery pack to run a 150-170 watt radio or brick or an antenna with equivalent gain is not realistic for back country use. Bob implied this in his response.

Low Earth Orbit satellites are the key to increasing both utility (read usability) of ham sats. By reducing the cost to participate the user base will increase as well as potential membership in AMSAT. This is the mistake that was made with P3D. Satellite based APRS is a prime application for LEO sats for all the reasons Bob has expounded on over and over on this SIG readily available equipment low path loss at VHF no Dopplar correction small light antennas.

The fact that the satellite is only in view for brief periods is a workable problem and far outweighs the benefits of high orbit for mobiles and back country users. The solution as I alluded to in my last post is more small CHEAP Sats not more big expensive ones.

But the cost would rise dramatically, as would complexity. A power amp would be way cheaper to install and maintain.

Does it have to be exclusively one or the other? When PCSAT finally goes silent, won't we still have ISS? And others? Adding a geostationary APRS satellite would be a tremendous addition to what's already up there.

I never said it was practical! Some things just have to be done once
because they're cool projects. Ok, cool in a geeky sort of way. ;-)

Points well taken though.

Maybe the answer would be to put up more LEO satellites. This would
increase the amount of time available to the SATCOM community. Of
course this would be LOTS more money...

I just programmed a KPC-3 for WIDEn-N and realize that we should be using
the TOCALL to identify the software version using the APNxxx version
numbers.. something like APNK83 to show a "Node" using a Kantronics
version 8.3 ROM. Put APNK83 in the UNPROTO and in the LTPATH commands.

I wouild suggest:

  APNK83 for a KPC-3 version 8.3
  APNP83 for a KPC-3PLUS version 8.3
  APN983 for a KPC-9612 or KPC-9612PLUS

Just a thought.
Bob

I am not sure that several LEO sats would cost more than one P3D type of
sat. I am also under the impression that high orbit has much higher launch

cost in addition to the satellite cost.

Anyone know how much AMSAT spent on P3D?

I would also love to know an approximate cost for PCSAT, both the original, and an estimate of what it would cost to build a new and improved one. How about it Bob is this information available? Until this information is available no cost/benefit ratio can be calculated. However I suspect that such a ratio would be heavily skewed in favor of the LEO.

I am not a satellite guru simply due to the expense in knowledge, time and money required to work the rich man's toys.

Version 8.2 works in the KPC-3.

I'm running that at home.

OOps...BAD IDEA. The P should be used for PACCOMM roms. SO here is what I have now penciled into the list of version numbers...

```
   APN383 for a KPC-3 or KPC-3PLUS version 8.3
   APN983 for a KPC-9612 or KPC-9612PLUS
   APNP50 for a Paccomm version 5.0 etc
   APNMxx for MFJ, etc
```

I guess, Fred, that could be right. Our club has many KPC-3
and KPC-3Plus. I guess I just don't remember gettin'
any KPC-3s with the Ver 8.x in them. I've gotten
KPC-3Plus with 8.2 and later 8.3. Same-same with
KAMPlus that we use for Gates.

Now I order them with K-Net-8.0 in them. Retrofitted
the KPC-3s with K-net 6.0

Well, it is possible that we got some KPC-3s with Ver 8.2
in them. I just don't remember. Remember gettin'
8.2 in some Plus models. But hey we've been usin'

them for years and 20 some odd of them, so I coulda
gotten one with 8.2 in it durin' the transition from KPC-3
to KPC-3Plus.

Matters not anymore, 'cause all have been fitted with
K-Net 6.0 or K-Net 8.0.

> load it with as MANY different users as we can. Target is THURSDAY....

ARGH! We were one day too late. PCsat was back into 29% eclipses today,
and it reset and we didnt catch it in time so the batteries are too low to
keep it programmed. The first pass of the test, I got her into low power,
but too much risk to try to load everything else. Batteries were already
too low. SO the only digipeating callsign that would work today was via
W3ADO-1.

I saw 13 different calls today and a handful of new calls lastnight..
There were probably many others using the suggested RELAY and WIDE
aliases, but PCsat didnt recognize them because it reset during
eclipse.... Sorry. Use W3ADO-1 as the only thing that can be supported at
this time...

Bob, Wb4APR

```
Dont hold me to this:
$   2K in hardware,                            }Add these up
$  10K in spares                               }to arrive at our
$  38K in NASA/DOD meetings, travel, phonecalls  }$50K budget
-------
$ 200K Probable labor cost      (THis was just our job)
$3000K was our share of Launch  (DOD had already paid for the launch)
```

BUT, our mission was EDUCATIONAL, so RISK was acceptible. In the real world, there is no way anyone would risk a $3M launch cost on a cheap satellite. Its not the cost of the satellite, its the TWO MAN YEARS of preparations, meetings, presentations, travel, negotiations, testing, that eats up (burns out) people...

I'm thinking about putting a set of rocks for the Sat freq in my Mytrek so that I might hit the bird when there's no digis, flip a single switch? Maybe keep an eye on the "busy" led to know when there is a pass or a digi close. Maybe replace the kpc-3 with a Pic-e to have two different beacon rates and paths with the flip of a switch? Or maybe borrow some of Wes' techno and have a pic/stamp listen to both channels and pick the active one and do smart beacons too.

Lots of possibilities!

Yes there is. 8.2 for the KPC-3 (not plus)
And to top that off, there are THREE VERSIONS, all called 8.2 (thanks
Kantronics)
Two of the versions have MAJOR problems!

         Seems I heard of a group doing exactly that a few years ago.  As I
recall, they were inside the ham band, thus their signals were about -60 dB
because of the filters in the satellite, but IT STILL WORKED.

         Anybody else have the details of this?

We were offered a ride to GEO. The goal was to find some use for a satellite at that range for APRS. At 22,000 miles versus 2,000 miles, Thats a factor of 10. and in radio that means it takes 100 times more power. There is just no way any lightweight mobiles are going to hit that bird without hundreds of watts or long beams at 2 meters.

It seemed a lot easier to add a 170W amp to a mobile than a 26 element crossed beam 10 feet long to an HT. So we went with the 170W into a 1/4 roof vertical for an ERP of 300W. Since the 1/4 wave has max gain up at about 30 degrees elevation, and the Bird is up that high or higher in the GEO orbit, then there was an additional 6 to 10dB suppression of all terrestrial APRS activity that tends to focus its energy on the horizon. Thus at 22,000 miles up, the only thing the bird would hear by a margin of 16 dB or more would be the high power mobiles and all the rest of 144.39 activity would be below the noise.

Thus we could operate on 144.39 with no congestion. Thus we did not have to ask AMSAT for another 2m FM frqunency which everyone told us was not available anyway. And by using 144.39, these same mobiles would be tracked terrestrially whenever they were within range of the terrestrial network without ever changing anything.

For the orbit offered, it seemed like a great design that minimized interference with other AMSATS, and maximized the usability of the mobiles that needed the continent wide coverage.

No, it did not serve the HT's, but that is impossible from that distance with an unstabalized spacecraft with no antenna gain possible on the bird.

Hello everyone. I know this has been a burning question for everyone envolved and made donations. The findu.com backup server was ordered tonight. I will post the specs when it arrives with an estimated time frame on when it will be online. I aplolgize for the delays. I do need the gentleman who represent DWR race support to contact me off the sig. Congradulations to everyone who made donations. We exceeded $5000 dollars. I plan to update the web site with the rest of the names and the total amount raised on sunday evening.

Thank you to all envolved and those you volunteered to help out. You guys have made this possible and you will be pleases with what you get in return.

We followed Steve recommendations with the exception of a RAID array and tape backup. The machine will not have it's full memory installed. Dell is proud of the prices on their memory upgrades. We are going to obtain that at a lower price locally. It will allow for more memory for the same price. Target is 1 gig of ram. The rest of the specs will be posted when the system arrives.

Getting the D700 to tell you which channel (side of radio) is busy is really easy. That would be a REALLY slick idea.... to have one side scanning the satelite downlinks and the other on aprs.... when you get a "ding" on a satellite freq, the d700 spits out teh freq and squelch reading. You just send the commands to swap the data side of the radio for 10 to 13 minutes (the longest pass). This is really a great idea Doug! It would be really cool if when you weren't talking on the voice side, if it would scan or set 145.825 as a call channel and check it periodically... then the pic processor would see the "ding" and know if the freq was 145.825 that it needed to switch modes.

Wes

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS SIG <aprssig@lists.tapr.org>
Message-ID: <LYR842-87058-2002.06.27-23.31.56--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
I need data from everyone that attempted to transmit during the thursday
afternoon PCsat LOAD test.  Whether successful or not.  Send private, I
will summarize.

Since PCsat had reset and was only digipeating packets via W3ADO-1
we want to know about anyone else that was on 145.825 even if you were
using RELAY or WIDE too and even if you were not successful.

Reason is, that even though your packets may not have been  digiepated,
because of the path mix-up, they did represent a full load on the uplink
channel so they do count as  part  of the load.  For the purpose of
documenting this test, it would be nice to know:

Power:      ________
Antenna:    ________
XMIT Rate: ________  (no, we will not criticize you)
PATH:       ________
Assesment: ________ mitigating info to explain why you might not have
```

gotten in. (wrong time, wrong path, long coax, etc)

Calls logged so far. (Only report additions.)

AA3VO,AA9LC
K5OE,K9ORP,KB0VBZ,KB1GUE,KB1GUE,KC0JHQ
N4QWF,N6JLH,N6CO,N9ORP,N8ORJ,NP3ZY
W3SMK,W4JBB,WA4SAS,WA4SSP,WB4APR,WB4JBB,WB8NW
VE3DOH,XE2ARF

I saw very little get to the APRS-IS, though I had 13 stations logged on my receiver... But I left that at work and those calls are not included here.

Rendered body type: text/plain

Using PCSat is hugely frustrating.
    In March, I did a 5,782 mile American road trip and planned to use PCSat since I'd be out in the middle of nowhere for most of the western leg. It turned out that week the battery was totally shot and the satellite was closed. The only way I knew that was I read this list when I got home.
    For Field Day this year, I was on my way to Denmark by way of Newark and London. I figured on those layovers, I'd be able to make a few PCSat contacts from the various airports since it would be fairly active. No such luck. Low sat batteries?
    Several nights this week from Aarhus, Denmark, I have tried to contact PCSat using the RELAY path without any luck. I don't know if that is because of the path or a battery situation. In any case, there was no satellite love to be had.
    Eventually, I gave up and used a ground path (wide @ 144.8). I heard much traffic and made it to FindU...
    http://map.findu.com/k4mls

    Between the battery situation and the constantly changing path (not to mention trying to figure out when it is overhead), it really is a pain to use.
    If I had but one wish, it would be that you pick a path and stick with it no matter what. I know that W3AD0-1 will work all the time but on a number of occasions you have said not to use that because of low power. So, users have to guess which combination of RELAY, WIDE, ARISS, NOCALL, etc. is active for the day.
    It's a real shame that PCSat is so flaky. The concept is awesome but the execution leaves a lot to be desired. I can't wait until there is a PCSat version 2.0 that addresses the bad solar cell, has a larger battery and a static path.

    Matt (k4mls)

Date: Thu, 27 Jun 2002 17:43:38 -0400 (EDT)
From: Bob Bruninga <bruninga@usna.edu>

> Since we blew it for fieldday (low bats), PCsat has just never
> gotten a full user load to prove its ability to support hundreds
> of users per pass. Before it goes back into maximum ecllipses, I
> would like to load it with as MANY different users as we can.

ARGH! We were one day too late. PCsat was back into 29% eclipses today, and it reset and we didnt catch it in time so the batteries are too low to keep it programmed. The first pass of the test, I

got her into low power, but too much risk to try to load everything
else. Batteries were already too low. SO the only digipeating
callsign that would work today was via W3ADO-1.

OK, It�s time to hit the road again. I am continuing my
trans-continental motorcycle ride from Key West to Homer, Alaska. I am
wired for APRS. The basic route from here is Pensacola to Memphis,
Kansas City, Omaha, Rapid City, Calgary, Edmonton, Ft Nelson, Tok,
Anchorage, and Homer. Sounds easy.
I'll be k1pns-14 on findu and/ or can get the whole story daily with
pictures and a find-u link at http://www.rwrockwell.com

Honk when you pass

Roger

Hi Wes,

Well, I sent it this mornin'.   0642 sounds about right.

It is 280754Q (281154Z) now.

How does it look? I haven't changed anything.

MYCALL won't take a slash on either the D700 or the D7. Some have suggested a hyphen ('-') instead. That may or may not be allowable. The best suggestion I have heard is to simply put your call in the status field and make sure the status field gets transmitted.

That is interstin' that Canada prefixes the foreign callsign, here in the states Canucks suffix the US call area, as in VE6###/W4. All other foreign callsigns, prefix the US prefix as in W4/G4###.

Do you know why Canada is bassackwards for US callsigns?

Well, Matt, according to Part 97, all forein callsigns
except those from Canada prefix the W# and Canadian
calls suffix the W#.   All foreign stations must at least once
durin' a conversation state their geographic location by IDin'
a town and state (or territory) near them.

I'm not sure it makes much difference. I've seen both OZ/K4MLS
and K4MLS/OZ style calls uses in America and around the world. I'm
pretty there is a 'right' way but I don't know which it it.

Matt

TNCs don't take the slantbar so what I did when I was in Ontario 2
summers ago I put /VE3 in my status text if my D7/D700 the position you
are transmitting gives your position so that would be just like saying
verbally where you are.

I was using my D7 with only 5 watts and had a great track from Detroit
to Toronto and north to Huntsville.

And goes into low-power fail-safe mode automatically without any command station control if/when it's in eclipse and the batteries _do_ get drained: One or two receivers on, cycled on/off at various rates depending on the power available, no digipeating, occasional transmissions to give the ground stations telemetry. Shut all that down and just cycle one receiver on/off if it's gets extremely bad.

Is there any way to keep LEO satellites out in the sun more? It seems unlikely. Probably with severe weight restrictions for launch you can't send up many spares either, like another battery or solar cell.

Talk about the ultimate harsh environment to try to keep something running!

Thanks to Bob and his group for the cool satellites! I haven't operated sats during quite a few years hamming, but I've been learning a lot from this particular project. I expect it's only a matter of time before I get bitten by the sat bug, particularly because people are making it easier and easier to do so.

The reciprocal agreement with Canada was written at a time when the prevailing practice for portable operation was to use the "foreign" prefix as a suffix. Times have changed, but that agreement has not been revised. I suspect you would not get in serious trouble if you did it the other way.

Also, label on top sez either KPC-3 or KPC-3P

I've been goin' through my box of chips that were
pulled when K-Net chips were put in and I can't
find any that have KPC-3 with a Ver 8.x.

I find KPC-3P chips in version 8.2 (1997) and
version 8.3 (1999).  The ones we order now come from
factory with K-Net 8.0 in them.

we have been over this before and I thought we beat it to death ... since you are transmitting your location there is no need for these contortions, just put your call in as normal and the fact that you are in Canada is clearly established by your also transmitted location. That is what Canadians do here in the Northern tier states and what us Northern tier Americans do in Canada every day ...

cheers ... n1bq in Underhill Center, VT

Been fighting a problem running AGWPE & UI-VIEW on Windoz 98 Se. Kept dying with page fault.

Tried on 3 different systems. 800mz 650meg, 16meg Video, 550mz 500meg, 12meg Video, and 500mz 512meg 12meg Video.

All got the same results. Run between 1/2 hour to 6 hours then die.

Finally put the system on a 266mz 32meg, 1meg Video and it has been running solid without a problem.

SAVE THOSE OLD PC's.

Amateur Radio phone transmitions are a broadcast media. Some people in this hobby are broadcasters (a oneway media) and so, this is what they do. They say a lot, listen little (if any) and learn nothing more. Others in the hobby are listeners, and receive what they hear without much response. Still others are two way messengers that give and take freely the information that they have access to.

The broadcasters are the most annoying and the listeners are the ones we have the most to learn from (they have heard it all). The two-way messengers hold the latter two groups in each hand and provide all this profound interpretation of what they perceive.

We need all of these people. We just have to learn to live with them and understand their mental bias toward a particular mode of participation. And that participation may change over time based on the feedback we give them!

Message-ID: <LYR842-87149-2002.06.28-17.44.46--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The NEMA protocol is supported in this receiver. Receiver must be programmed
 with the software from the Trimble web site (ftp). This is covered in the PDF link below.

A TTL to Serial Interface must also be built (also in PDF) to access and use the receiver.

w9gb

Rendered body type: text/plain

Brian,

You are incorrect. Transmitting your lat/lon does NOT meet the identification requirements for reciprocal operation, in this country or any country that the US has an agreement with. The various reciprocal regulations are very specific in what method of identification is required (prefix (XX/) or suffix (/XX) of the host nation, sometimes indicating region or class of license).

AX.25 is not designed to support this method of identification (hence the reason a D7 or D700 does not allow this type of callsign). However, identification can be done within the text of the packet. On a D7 or D700, this means turning status on and putting the callsign with the necessary prefix or suffix in the status text.

I have traveled extensively internationally and operated in CEPT countries, Canada, and Mexico. All of these countries have indicated (via private communication) that compliance with their respective reciprocal licensing agreements are mandatory, inclusive of the identification requirements. The method of identification described in my second paragraph meets these requirements. If you are not identifying your station properly, you are in violation of the reciprocal licensing agreement.

961. [aprssig] smart beacon kenwood sucess!

From: "Wes Johnston" <wes@johnston.net>
Date: Wed, 26 Jun 2002 22:35:55 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87159-2002.06.28-18.25.36--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Yay!! first live test tonight.... I got smart beaconing to work on my
kenwood d700!! Rode around the block and it pegged all the corners! There
was a delay on one of the corners due to CDMA, but the kenwood was ready to
TX as soon as the channel cleared.

I've bought a 3/32" stereo extension cord for a cellphone from rat shack,
hacked it in two to get a male and female plug to insert in line with the

d700 GPS. In this way, the Basic stamp and the kenwood both see the GPS output and the kenwood is still able to upload waypoints to the GPS. I then wired one of the basic stamp outputs to pin 3 on the kenwood so I could send commands like BCN 0 and PS 1. I've also included pin 8 on the serial port of the kenwood as an on off indicator so that in the future I could power the radio on and off via software. I have been able to manually switch it on and off via software, just need to tweek the smart beacon program to add the timer for it to be fully automatic.

I tried this with pic basic pro on a 16f84 at various clock speeds from 4mhz to 20mhz with no luck reading the GPS reliably. Although the pic is cheaper, PBP's compiler is just not able to produce effecient enough code to read the continuous stream of data from the GPS. Perhaps a '876 with a hardware USART will be in the future version - because it's cheaper than a stamp. I have found a company which makes a thru-hole parallax licensed basic stamp2 for $31 and the stamp2sx for $39 ($20 cheaper than parallax). http://www.hvwtech.com/stampstack.htm . Soooo.... you can add smart beaconing to your kenwood radio for the price of a $31 basic stamp2. The interface to the gps and kenwood so far has required one resistor in addition to the basic stamp 2.

In a few more days I'll tweak some more and post a schematic and source code.

Wes

Rendered body type: text/plain

My experimental aprsd215 with full path tracing
enabled has logged these two packets
in the looped packet file. They were first received
from first.aprs.net then went back out and returned
from KG4JAC-2. He's running tk_aprs 0.6 . He seems to
have inserted "TCPIP,KG4JAC-2*" into the path. Also,
the packet is raw 3rd party data (starts with "}").
Weird....

```

Jim -

Take your choice of which surplus GPS OEM receiver you would like.
(They all will do NEMA, either out of the box or after programming or configuration)

B.G. Micro has the Trimble SV-6-CM3 model with a small antenna ($ 25)

In the $ 30 to 35 range you can get an 8 channel receiver on eBay
(and a better timing receiver)

The eBay seller (footsix) has had a number of Trimble Lassen SK-8 receivers for sale for past 3 weeks.
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1363127510

And if you want the Oncore GT Plus (like I just purchased for $ 31)
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1362506618

Take your choice, nice choice of antennas, as well

73 de w9gb
Greg

Rendered body type: text/plain

Greetings Roger, (and the rest of the SIG)

Once you cross the boarder between our Nations, yes you will find that there are *many* differences in both our Culture, Language, and indeed the application of H.R.H.'s Laws.

We are some what "laid back" (from your Government's point of view) as well as many members of the SIG, who are really "hung up" over the rules (and are ready to quote you chapter and verse of part 97 of your FCC rules and other international rules). But let's be *real* here, for a minute.

I would recommend, that you use just your U.S. call "k1pns-14" as your call for your Position - anything else is just going to cause confusion downstream as IGates and other systems try to parse your information.

If you want to be "squeaky clean"; then you could add to your Beacon text "Motorcycle mobile in VE6 land" or some such. If you beacon that every *half hour*, that meets our Canadian Industry Canada (DOC) requirements.

Remember, up here every Radio Officer (with DOC) is also a "ham" ... and while "Hey, while your APRS position in AX.25 is not "internationally" recognized as an offical replacement for other written rules on identification; it's still cool. If an R.O. happens to be monitoring the Amateur frequencies, not likely, as they are very short staffed and have a plate full with cable companies, cellphone companies, commercial stations and broadcasters, it's not likely that you're even going to be even monitored. Obvious violations, like transmitting outside of the Amateur bands, spurrious emissions, or "profanity" *might* get their attention - more likely it would be a Canuck ham that catches the above and then report first to you, (as licencee of the station) and if ignored then to I.C. for action.)

So, relax, enjoy your ride and Enjoy Canada !!! Remember too, that two dollars U.S. is about equal to three Canuck bucks - which BTW are coins ! (The one and two dollar notes have long been removed from circulation to the general public.)

And what better, after a long day's ride, is to try a *real* Canadian beer ? (Once tasted, you're hooked, and will never have an 807 other than one that comes from Canada !) In itself that should make up for our governments' disagreements over softwood lumber ! <g> But once tasted, don't even *think* of ridin' your "mount" in my Country !!! Canada has some of the strictest (rightly so) rules about "drinking and driving" (ridin')

in the World ! The snag here is, if you get caught, not only will
you be fined, and possibly "deported" - *but* worse, Canada has
an agreement with the U.S. authorities ... You'll be paying a
huge amount for your bike and car/truck insurance for many
years to come, if you're caught up here, for "drinking & ridin" !

Enjoy the freedom (and be aware of your responsibilites) while
ridin' through my Country !

Your brother on two, vy 73 de John VE3NEC
905-873-8715

```
I just got my Basic Stamp II sx in from the vendor tonight and soldered it
together.  It went very very well and I now have a stamp for $20 less than
parallax charges.  Tomorrow I'll put the smart beacon code on it.

In the mean time, they sent a catalog and I saw a pic protoboard in there.
I didn't realize such a creature existed.  $9 for 16f84's and $14 for
'876's.  They are already set up to install your 7805's, crystals or
resonators, and come with a holes for a DB9 or DB25.  Silkscreened and
labeled well.  Boy if it'd only known this, i'd spent alot less time making
the same "xtal here, MCLR here, power, grounds" on radio shack perfboards in
the past several months.

Wes

Subject: findu.com backup server has been ordered
From: "Guy Story, KC5GOI" <kc5goi@kc5goi.net>
Date: Thu, 27 Jun 2002 21:30:45 -0500
X-Message-Number: 43

Hello everyone.  I know this has been a burning question for everyone
envolved
and made donations.  The findu.com backup server was ordered tonight.
I will
post the specs when it arrives with an estimated time frame on when it
will
be online.  I aplolgize for the delays.  I do need the gentleman who
represent DWR race support to contact me off the sig.  Congradulations
to
everyone who made donations.  We exceeded $5000 dollars.  I plan to
update
the web site with the rest of the names and the total amount raised on
sunday
evening.

Thank you to all envolved and those you volunteered to help out.  You
guys
have made this possible and you will be pleases with what you get in
return.

We followed Steve recommendations with the exception of a RAID array
and tape
backup.  The machine will not have it's full memory installed.  Dell
is proud
of the prices on their memory upgrades.  We are going to obtain that
at a
lower price locally.  It will allow for more memory for the same
price.
Target is 1 gig of ram.  The rest of the specs will be posted when the
system
arrives.

Steve..

There are a number of PIC Proto boards out there, depending on the processor you are running. I have designed two such boards, one for 28-pin processors (such as the Microchip 16F873 and family. The second board, designed for 24-pin BasicStamp type processors (such as the NetMedia BasicX-24 and the Parallax BASIC Stamp 2, Stamp 2e Stamp 2sx and Stamp 2SX Plus.

Each of these can be found on eBay at:
- http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1743861933
- http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1743862299

Or.. If you can't wait for an auction deal, they can be ordered at:
www.projectx.com under "Placing an Order".

john

Yes, I agree. That is one thing I hate about sats too is that they must be in the same mode ALL the time or users get frustrated..

Thanks

Can they also indicate if ID or NOID is set? and if ID is set to change
the overlay character to an "I" so that users can know what is in use?

WIthout this overlay, digis with "ID" work completely different from other
digis with "NOID" set and users need to know the difference.

```
NOID:  "K4HG>CQ,DIGIx*,WIDE2-2"  indicates FIRST digi was DIGIx
ID:    "K4HG>CQ,DIGIx*,WIDE2-2"  indicates LAST digi was DIGIx
```

So you see unless we know what digis are "I" digis, no one knows how to
interpret paths..

Thanks

This is just an alert to any on the APRS sig that dont keep up with satelites, but there is a new satellite in orbit (not for APRS), but very popular if you have VHF/UHF all mode. It is AO-7

AO-7 is over 27 years old, and died in the 80's, but last week or so it has come back to life randomly. It was one of the best AMSATS because it has a full linear transponder and can support many SSB and CW QSO's. And it only takes a few watts to hit it..

It seems to come on randomly about half the orbits or so...

ANyway, I just thought I would share the exceitment that is keeping everyone entertained over on the AMSAT sig. There is no APRS application and FM is not desired on this satellite, so no need to clutter APRSSIG with email. Just search for AO-7 or OSCAR-7 becuse in the last week or so, many new WEB pages have popped up to support the interest..

But with all those little VHF/UHF all mode rigs these days, it is very exciting to work a satellite

On Sat, 29 Jun 2002 k9soa@att.net wrote:

> What is the difference between the ID and NOID?
> Your examples are exactly the same.

Yes, that is the whole problem. Users cannot tell the difference at all, yet the interpretation of the packet is entirely different. Not an issue with locals, but makes APRS for travelers and anyone via the internet clueless.

> For setting ID/NOID is there any preference?

Yes it should be NOID, the default. If the SYSOP sets ID to ON, then that digipeater inserts its OWN call in every packet and overwrites any previous path data. This loses important info.. It is more importatn to know the first digi used by packet than the last (the last is usually the one near you, and you alredy konw that)..

So having NOID is best and serves the users and the network best, because it asures that packets arrive everywhere with the identification of the first digi intact. This allows for all kinds of benefits.

Conversly, Having "ID" set is thought by some SYSOPS to be best, because then as they drive around, they can see what packets were last digipeated by their own digis. Yes, good for digi coverage studies, but since this can be done EQUALLY well by just sending any packet via TRACE, it seems a shame to have this enabled ALL the time at the expense of the users or the network.

Problem is, it is the SYSOP that gets to set it the way he wants...
So I have given up arguing with those that prefer ID ON and only ask that they at least identify their digi's with the "I" overlay character so that users will konw how to interpret packets.

Othewise, users have no clue which way to intepret these packets:

```
> NOID:  "K4HG>CQ,DIGIx*,WIDE2-2"  indicates FIRST digi was DIGIx
> ID:    "K4HG>CQ,DIGIx*,WIDE2-2"  indicates LAST digi was DIGIx
```

Subject: RE: [aprssig] Colorado Front range DIgipeaters

Bob , all , right now I just was to come up with a graphical map like what is posted now , but showing the projected coverage of the digis for the web site. we have the three there now. I was talking to n0wbw about plugging our digis into MicroPath , and then thought would in not be neat to get all the Rockies front range digis plugged in and have a look of what the coverage from them should be and in spare time maybe do a little drive testing , like we did when building the early cell system , to compare real life with MicroPath's thinking

Can they also indicate if ID or NOID is set? and if ID is set to change the overlay character to an "I" so that users can know what is in use?

WIthout this overlay, digis with "ID" work completely different from other digis with "NOID" set and users need to know the difference.

NOID: "K4HG>CQ,DIGIx*,WIDE2-2" indicates FIRST digi was DIGIx
ID: "K4HG>CQ,DIGIx*,WIDE2-2" indicates LAST digi was DIGIx

So you see unless we know what digis are "I" digis, no one knows how to interpret paths..

Thanks

982. [aprssig] KPC3 ID/NOID settings

From: Mark Cheavens <mcheavens@usa.net>
Date: Sat, 29 Jun 2002 11:40:45 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87283-2002.06.29-12.18.08--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Furthermore the KPC3 (version 8.2 rom) has packet duplication problems. I have been playing with my first KPC3's (I just got two of them) and now have been able to see exactly what is going on. I have determined that KPC3's should NOT be used in metro markets where more than one digi might hear a packet directly! It's packet duplication routine does NOT work. It might be ok in an area where it is serving as a way for two digi's to talk to one another or in a low volume area. Here is a link to some packets and a screen

There are some other files that many of you might be interested in.

http://www.cheavens.com/mark/radio/packetradio

KPC3packetduplication.doc is the description and comments about KPC's and packet duplication

W5MAYkpc3digiCarlsCornerpublic.txt is the config file for (one of) the KPC3's used during this test.

PHGAPRS.xls is the PHG range circle RADIUS spreadsheet. If you put in the PHG numbers that you THINK you should use. It will give you the circles

RADIUS in miles. Useful to use to make the correct PHG numbers for a digi.

25Packets-Preemphasized-Audio.wav This is the file that I play in loop mode
on my computer and feed the output of my computer into my service monitor
for checking the decode performance of a digipeater with a service monitor.
The audio is pre-emphasized at 6db per octave as it should be so that you
can scientifically test for changes when tuning the receiver and tnc. Find
the point on the attenuator where you both START to decode packets
(threshold) and where you are decoding 100% of the packets.

There are also versions of this with FLAT audio, but this should NOT be
used in NORMAL AFSK situations. I use it as a quick test to see if someone
is using descriminator audio with no de-emphasis network.

From a previous post someone mentioned that there are multiple versions of
the KPC3 (not plus) 8.2 software. How do you determine which build it is?
If I do a VER command I get KPC3-3F427265-8.2

983. [aprssig] Re: KPC3 ID/NOID settings

From: greg@clubnet.net
Date: Sat, 29 Jun 2002 10:23:18 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87285-2002.06.29-13.04.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The inadequate packet duplication checking algorithm of the KPC-3/KPC-3+
is the main reason the SysOps in Southern California decided to
configure the LA metro area digis to respond only to WIDEn-N and
TRACEn-N. The algorithm only checks for duplicate packets that are
addressed to digipeaters names defined by the UIFLOOD and UITRACE
(typically WIDEn-N and TRACEn-N) parameters of the TNC. It DOES NOT
check for generic RELAY or WIDE.

In metro LA, with its overlapping digi coverage areas, it is quite
possible for a station to be simultaneously received and digipeated by 4
different digis. You can imagine the nightmare that would occur if a
packet addressed to RELAY,WIDE,WIDE were heard by four KPC3-based digis
that responded to RELAY and WIDE.

One potential solution is to move from the KPC3-based digi to a TNC-2

using UIDIGI firmware. When I first started using UIDIGI a couple of
years ago (version 1.8 Beta 6), the duplication algorithm wasn't
perfect, but was far superior to the algorithm of the KPC-3. Marco
(UIDIGI author) has recently released version 1.8 (non-Beta) and may
have taken care of the remaining issues.

I have been using only UI code for a couple years in SE Texas. I just came
across a couple of KPC's at the correct price recently. I am VERY impressed
with there ability to decode packets WAY down in the noise floor. Better
than I would have expected possible. My next plan is to either duplicate
the filtering used in the KPC for use in a TNC-2 OR is anyone interested in
clean room reverse engineering the KPC firmware?

It CAN be done...but has to be done right to prevent legal action. The best
solution would be to have Kantronics FIX their code or release the
source......If FIXED I would BUY it (and more of their hardware).

I am also looking for a single board PC that has a boot rom (no moving
parts) to run Digi-Ned from. This would be a quick fix for the KPC's.

Does anyone have any contacts at Kantronics and has anyone talked to them
about it?

         My opinion of a better solution is to run the KPC in KISS mode and
use one of the computerized digipeater programs.  That way, you get the
sensitivity of the KPC-3's modem, along with the configurability of the
computer.

         I doubt they will EVER release their source code.

Rendered body type: text/plain

```
Hi.

I managed to get my hands on an Kantronics KPC3+ V8.3, and would like to
use it as a standalone digi. The box is configured and running, and seems
to do its job just fine - with the one exception that the posit packets
generated by the TNC itself are not picked up by anybody, and also do
not show up on my other (AGWPE) APRS station.

Funnily enough, APRS packets *digipeated* by the TNC are working just
fine, and the TNC also works for connection into the packet network, which
sort of rules out TXLevel/TXDelay problems. I'm using static (LT/BLT)
posits, with no GPS attached.

Any hints?
Thanks && best regards,
-daniel

But you lose the extremely low power consumption and "turn-on and forget"
simplicity of a ROM-based TNC-only approach. UI-DIGI on a TNC2 is great this
way -- all critical settings are "frozen in stone" and survive power outages,
accidental resets, etc.   Much better than depending on a PC at a remote
site.....

What we REALLY need is a UI-DIGI-style APRS-only replacement ROM and/or
programmed 68HCxx microcontroller for the KPC3/3+

This issue has been on threads on this list before. For those that want to
pursue the possibility of a KPC3 "brain transplant" UIDIGI-like solution, I
still have a high quality scan of the KPC3+ HARDWARE schematic on my web site
at:
    http://members.aol.com/wa8lmf/kpc3/index.htm

Only HALF true. Yes, it will take more power than a TNC alone, but you can set these programs up to run from a floppy, and to automatically run when the computer boots up. That will give the "turn-on and forget" simplicity" you're looking for, along with a MUCH more flexible setup.

993. [aprssig] Low power and reliability

From: John Kraus <jfkraus3@cox.net>
Date: Sat, 29 Jun 2002 19:15:08 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87309-2002.06.29-18.52.55--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I first sent this to someone who asked how I was running the NA4V-2 digi. I thought it was appropriate for the SIG so here it is. While this does not achieve the ultimate in low power with no HD or the HD turned off power draw should be quite low.

No, I have not measured it but I will be happy to detail the system if someone wants to do so. My point is power consumption is, at most sites, a non-issue. If it is a remote solar powered site then by all means use the best low power gear. I can see the need if this is the situation but if it is grid connected get real most 386 / 486 computers draw less than a couple of light bulbs when the monitor is turned off.

The longevity issue is far more germane but can be addressed. See the last TAPR Packet newsletter on how to harden a computer. Actually the ultimate in low power is the TAPR compact flash adapter which also avoids the lack of reliability inherent in a floppy disk or hard drive since it has no moving parts. In the absence of the adapter I use basic dos and bios commands to create a Ramdrive and then after copying the necessary files to it I turn off the hard drive in bios.

I use the dos choice command to do the grunt work of reloading the system after a power failure.

It works like this:

CONFIG.SYS

load Ramdrive and memory manager

AUTOEXEC.BAT

Display a menu that gives ten seconds to exit to dos. Provides a nice way to stop the digi.
Then if Yes is chosen or time elapses all files in C:\digi_ned are copied to the D:\ Ramdrive then a rundigi.bat file is called from the D:\ to start the digi. I also wrote an update.bat file that lets me change settings at home. When I go to the digi I use the ALT D command to shell out of digi_ned pop in the floppy and type a:\update and the new files are copied to the c:\digi_ned and c:\ directories. Then pop out the floppy and hit reset and the new files run. It works great. Try updating settings in a TNC only system. It ain't that easy.

I don't worry too much as I only live about 7 miles from the digi by interstate. I keep a spare computer in the cabinet so its a 15 minute job to drive out and swap. So far I have not had any need. I suspect that DOS will be very stable in this environment since it is a small single task program with minimal memory requirements.

For more remote sites it should be easy to build a DTMF controller to power cycle. Just put a relay in the line to the power switch and use an old scanner set to 440 for the control It is not the most secure method but it should suffice to avoid a trip to the site during a thunderstorm. I have also seen a heartbeat circuit on the Digi_Ned site that takes a clock pulse from the computer to keep a timer reset. No pulse and the timer counts down and power cycles the computer. By using a Ramdrive the original files are less apt to be corrupted by a power cycle.

Ask anyone who is familiar with Linux how long some basic computers run without a reboot. I have seen a reference to a 386 system that provided Email service to a 200 user WAN that had more than 4 years of uptime without a reboot. The BBS at the same site has run for several years with only sporadic reboots but with no hardware failures. It is a second hand 386 running Linux.

The bottom line is that computers can do the job if set up properly.

Subject: [aprssig] PCM/CIA to serial?

Is there a PCM/CIA card available that will allow one to plug a DB-9 serial cable into it? Still trying to hook up a GPS to a laptop while leaving the one com port open for the TNC.

No, I don't want to use the sound card as a TNC...

Thanks,
Earl

Darned if I know! What we want to do is plug a card into the laptop's PCM/CIA port and be able to connect the GPS to it to get data into the laptop for WinAPRS mobile.

I use a SOCKET dual I/O card . One I/O for the GPS and one for
the weather station while mobil. The laptop has one existing serial
port for the TNC. Works great although a little pricey.

There's a number of them.  1, 2, and even 4 channel serial cards.
However, they are not cheap.  Real Time Devices in St College PA
sells them.  I think MetraByte in Mass does too.

Be aware though that if you are running 'DOS' compatible machines,
then you will have a 'gotcha' in that there is only ONE interrupt pin
per card slot.  With Win9x and later, it's not a big deal, but with
DOS it is.  Unless you have the capability to interface to a custom
driver...  (If you have to interface, just set the card interrupt to a
'custom', and then have the ISR routine 'pretend' to be one of 4 other
interrupts.  Better yet, writ your own 4-port handler and make it
support the one interrupt!)

Mike

1001. [aprssig] WinAPRS261 Problems?

From: "Stanley T. Yamato" <yamato@trianglenet.net>
Date: Sat, 29 Jun 2002 19:25:50
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87318-2002.06.29-20.03.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hi,
Hope someone will be able to assist me in solving a couple of problems that
I am having with this version of WinAPRS.
1. I am using the Davis Vantage Pro weather station with the Weather
Display program.  What are the settings for the Weather Display program to
interface with WinAPRS and what is the settings for WinAPRS to interface
with the Weather Display program?  I have the Weather Display to produce
the "wxnow.txt" file but it seems that WinAPRS does not pick it up for some
reason.  I have the bottom WX Display (File) selected in the Weather
Settings portion and in ghe Weather File Path I have the path where the
wxnow.txt file resides.
2.  I am using Precision Mapping 5.0 and it seems to be working in the
"square" mode okay.  Now, when I zoom in to show street level closeness,
the call sign background is white and covers up the map background.  The
icons seems normal. When I zoom out to about where I can see most of the
State boundries, the white background disappears. Is there a remedy for
this?

Hope that there are some solutions for my inquiry.

Thanks in advance.

Yes, assuming you want to run under Windows Getting PCMCIA cards to run under DOS is a real pain in the neck because:
1) DOS doesnt recognize PC cards by itself -- messy drivers are always required.
2) The 640K RAM CRAM issue; i.e. the the multiple layers of drivers normally have to load into conventional memory. With Win 9X or later, the driver stack for PC card slots is standard equipment and pretty much automatic -- just plug the card in.

At least if you don't try to use a modern 32-bit CardBus PCMCIA card on an older laptop that only supports the original 16-bit PCMCIA interface! [The classic 16-bit PCMCIA card interface approximates the interface of 16-bit ISA slots common on pre-Pentium PCs, while the 32-bit CardBus interface on current laptops is similar to the 32-bit PCI slot.]

A serial port on a PCMCIA card runs about $100 to $150. I was recently looking for one myself and was shocked at the cost -- you can get far more elaborate devices like 100MB Ethernet interfaces and 56K modems for half the cost of a dumb serial port alone! After seeing the cost, I went with a couple of the $25-$30 USB-to-serial converter cables -- again a non-DOS-friendly solution....

Old DOS junkies will remember these... with either HIMEM and EMM386 installed, or, even better, QEMM (Quarterdeck Extended Memory Manager), you can load these drivers into high memory (the space between 640KB and 1MB in the addressing scheme) and free up the conventional memory below 640. I have several Toshiba T1910 laptops, which have QEMM, PCMCIA drivers (six programs!), and several other drivers loading at boot time (my recollection says about 10 TSRs/drivers total), and I still have about 610KB free in the 640 block. Most programs require at a maximum 600KB free.

Good luck ever getting USB to run under DOS.

Version 2.6.1 seems to have lost the ability to maintain the label settings
when zoomed in.  The earlier versions could be configured to provide a 3d
looking font label with a transparent background.  The label would
disappear when zoomed out as you described.  Now, the label settings
(Display, Map Display Options) seem to have little or no effect.

There does not appear to be any way to get 2.6.1 to display the labels
similar to previous versions.

Have you installed any new software lately?? I had a similar problem a year or so ago after installing a shareware program. I can't remember the name of the program, but I think it was a program to stop popup ads or something like that.

No, I've uninstalled WebWasher some time ago, as it seemed to be pretty flakey.

Rendered body type: text/plain

All:

Has anyone successfully integrated WX-Display & WinAPRS 2.61?

I was trying it tonight, and even though I had WX-Display creating the file, WinAPRS would never read it. I set my WX options for the location of the file, and made sure that I had the right pathing (and capitalization, just in case that mattered).

I tried opening the WX port, but I'm sure that isn't it since all that does is open the serial port (which was dedicated to WX-Display)

Can anyone think of anything I missed, or give me some pointers?

73!
Chris N4BSA

Compared to QEMM and a little manual tuning, Memmaker blows. With QEMM, you can go in and see the different regions of upper memory and how much space is available in each, and then, by looking at the driver/TSR sizes, you can come up with a good idea of where to load each program. The only thing to think about is programs/TSRs that load larger and then shrink once they initialize. Later versions of QEMM (7.0, if memory serves - that's been awhile) had ways to handle this.

Work cleared out a bunch outdated equipment that wasnt being used but is functional. I have been wanting to move my wx server and aprsd Igate off onto a stand alone machine so that my main linux box is available for more play(read booting into windows once in a while to run flight sim :))

Anyway, the tower that I want to use is an older large gateway 2000 tower that is a P5-90 with scsi. It has a NEC CDR-501 cd drive and 2, 2 gig hard drives but the caddy has been lost. Actually several caddies were lost because I also brought home an external scsi cd drive and when I checked it, it was missing its caddy as well. Anybody either have a spare caddy or know where I can get one without waiting weeks? I wanted to load it this weekend but doesnt look like that will happen now. It has onboard IDE controllers but the motherboard apparently doesnt want to play ide and scsi at the same time. This surprised me because the last server I dealt with was a new Dell with a Raid scsi controller for hard drives but the CD rom was an IDE drive and I didnt have a bit of trouble just dropping linux on it. The IDE controllers appear to be enabled in the bios and did not see anything obvious on the mb that would disable them.

'course once I put that tower in my shack, I may have to finally build another room for the radios. The "closet" is running out of space quick.

Any help greatly appreciated.

bob

I designed a hardware box to do this, multiplexing up to eight serial ports, full duplex, into a single port, with cross-coupling (Feed data from device A to device B) under software control, but I haven't had any luck in getting support for it in any of the APRS platforms.

If I could do this as a Windows driver, it wouldn't matter. It'd just be COM-whatever. There wouldn't need to be special support. You could even do TTL serial ports on the parallel port, too.

I think you'll find that the PC's interrupt latency and "accuracy" of timing available will prohibit this.

The solution that I built up, three years ago, was an AVR8515 processor, talking to multiple MAX3100 UARTs. Today, I would use a Mega-128 processor which would handle the host port, and the first device port, and then other AVR processors for the individual ports. The MAX uarts are pretty limited with no "smarts" and only 16 byte buffers. They also are rather awkward to talk to, but it's kind of involved to explain why.

Still, the idea is to send the data to the PC as packets, with each packet identified as to source. Outbound it's the same, except that the data is flagged to it's destination. Port to port copying of data can happen in the host, or in the box, and the box can "rewire" the connectivity when the host is not present, which has interesting implications for dumb/smart tracker mode switching.

I despise "HSP" solutions since they chop up the data, and corrupt the data coming into the systems. Given all the fun we've had over the years with data that isn't sanity-checked, I think it's a very defensible position.

In any case, I can easily port the software to the new AVRs, and the remaining hardware design would be trivial. Not much point in proceeding though, since there's nothing to talk to.

My point here is that the hardware is capable of what I'm suggesting. While MS
has been trying to abstract the hardware for a long time, they have no choice but
to permit drivers to be written.

> >While a hardware solution has it's advantages, it's more boxes and cables.
> >And the issue of support is still there.
>
> One box. One cable from PC to box, one cable from box to each device. I
> think that barring IRDA or bluetooth, it's provably the minimum number of
> cables per device.

And space for the box, and a separate power cable. I'm looking for something I
can tuck in my briefcase and use with my laptop, or stick in the car.

The solution you suggest doesn't add a huge burden, but in the cases that concern
me less is definitely better.

> What support do you think would be needed? 232 buffers in sockets,
> everything else should outlast the owner, software is buildable with
> freeware tools.

Your solution will still require support either from the application and then
only one application will be able to use the ports created, or an OS specific
driver, in which case all applications could use it. What you suggest here has
one big advantage; it probably won't require an OS driver to operate at Ring 0,
making the driver less critical and easier to write for the OS case.

> I know it's not the holy PIC, but I refuse to waste my time untangling
> procrustean machinery.

I don't have a sect in this particular religious war, my only concern is over
long term part availability. The AVR seems to be available and model selection
stable enough.

Ham radio hardware projects usually have long enough "product cycles" that they
often start deploying as their critical components go obsolete. Witness a lot of
the TAPR designs.

It seems to me that the arguments between you and I boil down to this:

David:

1) It can't be done on a modern PC

2) External hardware is easy

Rich:

1) It can be done on a modern PC (but I don't know all of the details required to implement it.)
2) External hardware still requires OS or application support that doesn't seem forthcoming..

As for 1) is seems we won't agree and 2) we agree, but weight the related issues differently.

>
> Terry

One of the big problems is the memory size AFTER load.  MemMaker
(and even a few others) had problems if the required size of the program
after load and running was larger than it's original image.

That's why I always wrote my drivers so that all the 'disposable' init
code
was at the end, and it would easily be smaller after load.  I'd always
create my 'buffers' so that they would use the disposable init area.

I was going to just make my program as big as it could be and then shrink
to run, but that has other problems.  You can run into a situation where
the
program won't load because the loader thinks it's too big.

Mike

You can even do this on a 286 class machine.  HIMEM.SYS will load
and give access to a lot of the memory arena stuff.  I wrote a small
program call UMBPRO.SYS a few years ago that gave all the Upper
Memory Block functions to the machine, in my case a PC-AT (80286)
running DOS 6.0.  Originally I did the program to use the extended 'SL'
register set of the 386SL to make memory appear, then for my home
AT machine, I did it by just putting SRAM chips in sockets.

> Good luck ever getting USB to run under DOS.
```

SOME USB will load from DOS. And while not common, there are
DOS drivers for some USB devices, just hard to find. To be honest,
though, I've never seen a DOS driver for a USB serial port, just for
stuff like keyboards and mice. Usually what's called 'legacy' devices
that are handled in the BIOS.

1026. [aprssig] Memory and drivers???

From: Earl Needham <needhame@yucca.net>
Date: Sun, 30 Jun 2002 07:30:03 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87376-2002.06.30-09.08.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I don't want to sound ungrateful, but I don't NEED all the messages about
memory managers and the like. What I wanted was a simple device to plug
into a PCM/CIA port and then allow me to connect a GPS to it. Somehow the
discussion morphed into a discussion of QEMM, Memmaker, DOS drivers, etc.

I'd appreciate it if all y'all would stop sending me a cc: on it, as I get
the list anyway. (For another week or so.)

The DTR line on my Dell laptop (running Win2k) serial port is always
high for some reason and as a result I can't do direct serial CW keying
through a Rigblaster Plus (has DTR LED to show state). Keys my rig
continuously. It doesn't appear to be a Rigblaster or keying software
problem because DTR is high before or after running the keying software
(part of Win-EQF). Any ideas on how to keep DTR low are greatly
appreciated!

Do you have the most current bios? Have you contacted Dell (if you have the
most current bios)?

This has come up before on a certain model of Dell (I don't remember which)
Laptop and Dell fixed it in the bios for that model. It might apply to
other models as well, or you may have the model in question.

NMEA IN/OUT on teh Garmin @ 4800 baud

press <func> and while the F icon is still on, press <sql> see _|-|_|-|_ on the display.
Hook up a PC and set the baud rate of the TNC to computer.

```
set mycall .... MY K0CQW-9
set which data to collect from GPS.... GPSTEXT $GPRMC
set baud rate on RADIO port HB1200
set baud rate on GPS port  GB4800
set TX rate... LOC E 3
set path  ... LPATH RELAY,WIDE3-3
```

Good luck!
Wes

1031. [aprssig] smart beacon

From: "Wes Johnston" <wes@johnston.net>
Date: Sun, 30 Jun 2002 11:43:43 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87410-2002.06.30-11.21.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here's the first draft of the smart beacon for kenwood d700 and basic stamp 2. For this code to work, you simply need GPS input on PIN P0, and Kenwood db9 pin 3 to PIN P1, and grounds, of course. Yes this code is sloppy... PBASIC does not allow for IF THEN ELSE, nor does it allow for IF THEN / ENDIF structures. I'll clean this up RSN, but have had alot of interest and want to get the code out fast as possible.

Smart beacon will beacon:
1. a fixed distance (actually, a number of seconds determined by your speed in KNOTS)
2. At the moment you stop moving, and every 30 minutes after that.
3. When you go around a curve, once you have driven in a straight line for a few feet.

Pros:
1. stops endless fixed position beacons of parked cars.
2. randomizes posit reports w/o coordination required by GPS Slot time methods.
3. Does not interfere with normal operation of radio (for the most part).

Cons:
1. Smartbeacon used on a kenwood radio will not beacon when you are talking on teh other 1/2 of the radio
2. If you are entering a message or viewing station list, and the smart beacon wants to TX, it escapes you from the menu. From the serial port, I have no way to know the user is viewing the station list or is trying to enter a message. Need a manual inhibit button. Something to put the stamp to sleep for, say, 60 or 120 seconds. Future version may query the radio to see if the user has switched off BCN command and use that as a hold off.
3. Smart beacon sure is chatty here on the east coast where we have many curvey roads.

Other applications I see for this are being able to power the radio on and off.

Although teh basic stamp isn't good at watching two serial ports at once, I'd like to be able to monitor 144.39 for information like the locations of digi's that may be on other frequencies, or for local paths in a given geographic area. Lots of potential here!

Wes

1032. [aprssig] WinAPRS & MFJ 1274 configuration HELP

From: "Blosberg, Dean" <dean.blosberg@medtronic.com>
Date: Sun, 30 Jun 2002 11:34:59 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87411-2002.06.30-12.12.40--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have downloaded and installed WinAPRS version 2.4.6 - not registered yet until I know it will work...

I am having problems with the WinAPRS program not wanting to communicate with my TNC.

When I go under Windows Hyper terminal and use the TNC like I would with regular packet I have no problem with the computer and TNC communication, I know the serial port works when not using APRS.

Using the WinAPRS and setting every thing up appropriately, port/baud rate etc. from the program, I get garbage as if I had the baud/parity /stop bit incorrect. I don't know if it a setting on the TNC or a software issue.

Please, any resolution would be great, looking at the literature they admit having problems with the software and serial ports. I have tried Win 95,98 and XP all on different computers and get the same problem with each. Any ideas would be appreciated.

I would love to get this going before the holiday weekend!

Thanks again,
 Dean N0HOY Minneapolis

Is there a way to use Garmin Map source at the map for WinAPRS?

You might want to try the program, Trackpoint.
ftp://ftp.tapr.org/aprssig/winstuff/aprsplus/Trackpoint.zip

As I get time, I'm going to look at porting this to the AVR in assembler.
Unfortunately, any interpreted language is going to be pretty slow, and
suffer in realtime work like serial.

The Mega series would be the easiest, since they have two uarts natively,
but I'm sure I can do an interrupt based receiver for the GPS at 4800.

Good job though! I want something like this stuck in my car's KPC-3.

In one word: NO! Garmin uses proprietary language and I don't think they
will ever give that out.

Precision Mapping maps work real well but they do not give you the topo
lines. I have been trying to get the Sproul's to modify their program to
allow the TOPO! maps CD's to be used but so far they have not succeeded in
this task.

You also may want to have a look at Dontronics:
http://www.dontronics.com/ssinfo.html and the simmsticks he has to
offer. He has for both the PIC and AVR uP's. I have purchased and used
several of these. They are very nice and relatively cheap considering
the US vs Aus dollar exchange rate.

2.4.6 has the Igate Mic-E conversion bug.  Where ever it's archived for download -
it should be removed and replaced with an updated version...  Hopefully one that does
NO Mic-E conversion on the IGate function.

Dave, I thought about it for my wife's KPC3 in her car, but most people (so
I thought) would likely choose a lower priced alternative like the tiny
trak2.  However, it's great to know that the MEGA has two uarts... That's
*really really* interesting info.....  For what it's worth, basicx.com makes
a basic stamp type chip that has two serial ports also, with 100 byte
buffers.

While driving around town today it dawned on me that the other market for
this basic stamp smart beacon thing would be IDEAL for dr-135 folks.  What
with all the word about them reseting and loosing their memories, this unit
could easily reprogram the dr135 at startup, and send set TX rate... LOC E 3
command as needed.

Wes

I belive it is possible I may have FRIED the cars'
computer with a 2M rig.....the radio always seemed
to SHUT DOWN, and not operate well;
likely due to the poor antenna that was being used.
Is it possible I FRIED the car computer by having a
BAD installation in the car?
The power cables were/are wired DIRECTLY
to the battery, through the fire wall.
I have been told it is quite COMMON to have the
computer in your car go BAD, and need replacing.
Due to the need of a solder lug, for contact on
the car battery terminal, the NEGATIVE terminal
was NOT well secure, this even caused the car to
not start, when the LIGHTS and DASH did come on.
I am wondering if THIS may have indeed FRIED the
car computer.

(The radio being used was (is) a Yaesu FT-2600M)

Dear Greg,
This is going to sound like a dopey question...especially since I think I'm
going to be stating the obvious (given the last two sentences above). Is it
your experience that WIDEn-N and TRACEn-N work perfectly correctly when it comes
to dupe supression (even if WIDE,TRACE and RELAY don't)?

If/when I get back into my serial box project, it will definitely go to a
mega128, and multiple smaller AVRs for the ports. I originally did it in
the 8535, and had only 512 bytes to work with for RAM. When you are doing
one host port, and eight client ports, that's 18 buffers to maintain, plus
it was also a DF unit which took a fair bit of ram itself. The MAX uarts
are funky to talk to, only have 16 byte buffers, and I had to put them all
on one int.
With the megas, I get 2k of SRAM, and I can have seven external ints, so
with the two ports onboard, I can get eight client ports, each with their
own int, and 500-ish bytes of buffer ram. Sweet!

Yup. Same here. The original design included a "command" channel, where you
could program serial port settings, handshake, etc, and also tell it what
you want it to do when the host is/isn't present, or set up canned init
strings for the ports.

Unfortunately, it's not going to happen until/unless one or more of the
authors decides to work with me on it, or I/we find someone to write driver
code that would set it up as COM-X-Y

Possible, but not likely.
You would have to induce enough RF into the computer to kill components
that are designed to survive 400V alternator load dump transients on the
external wiring.

Directly coupling the antenna out to the computer's leads would be one way
to kill it. Otherwise, I don't think you could transfer enough energy for
anything beyond a minor upset.

In my old explorer, if I ran >100W on VHF, the rear window wiper would come
on by itself.

> NO Mic-E conversion on the IGate function.
>
> Bill, WA7NWP

Bill, the conversion issue has not been addressed in later releases of
WinAPRS.
Roughly 12.5% of the IS Traffic is this conversion traffic per a quick
study.  A deeper study is currently taking place to come up with better
numbers, but if anyone has taken the time to watch the IS, it's obviously a
problem regardless of the lame excuses I've seen posted....and it's a
problem that can be easily corrected with a software change or a software
update.

For those running dedicated Igates, I highly recommend UI-View32.  No Mic-E
troubles and VERY VERY stable.

I think APRSD, later versions, have corrected this problem.....a setting a
sysop can turn on or off.  Can someone confirm this please?  If this is
correct, the APRSD stations could update and help the IS.
WinAPRS is going to need a software update to get around the trouble.
UI-View V1.67 and V1.69 do not have the problem.
I do not know about PocketAPRS or whatever it's called.

Jim, WA6OFT

I would have to agree with Dave Van Horn.  RF probably did not kill the
computer.  But a loose negative battery terminal might.

Ev,

I haven't done any serious testing for quite some time, but I don't recall any problems with the Kantronics algorithm when WIDEn-N and TRACEn-N were used. At the time, the checking was done to differentiate behavior between the generic routing and the n-N routing. Additional testing would be needed to prove that duplication suppression with the n-N routing works 100% of the time.

Due to inconsistencies in our WIDE vs WIDEn-n coverage, I typically run a packet which includes RELAY, WIDE and WIDE3-3 as a catchall. This provides us with some dupes depending on my location. What I've seen is that if my kpc3plus digipeats a RELAY or WIDE it does not seem to remember that it already digi'ed that packet when it comes around again as a WIDEn-n.

Wes

Use one gate of a hex cmos inverter as
as interface. Use a battery of at least
the expected voltage out of the DTR line.

Subject: [aprssig] Controlling the serial port

The DTR line on my Dell laptop (running Win2k) serial port is always
high for some reason and as a result I can't do direct serial CW keying
through a Rigblaster Plus (has DTR LED to show state). Keys my rig
continuously. It doesn't appear to be a Rigblaster or keying software
problem because DTR is high before or after running the keying software
(part of Win-EQF). Any ideas on how to keep DTR low are greatly
appreciated!

First off, Ian... on your post I see a CC to the list twice. Only a few
people do this to the list, and you're one of them. No big deal though.

I wonder... If I remember correctly, the original purpose of the DTR
signal was to indicate a unit was 'on'. I think in a lot of early devices
like teletypes it was wired right to the power supply. Now with
'intelligent' serial devices, that use of DTR sort of went away, and
since it is 'controllable' by a register in the interface, it's gained a
lot
of 'other' uses. Such as multiplexing or whatever. But every now
and then you can get a 'new' programmer who reads the 'old' spec
and has no idea how that relates to 'reality' of how something is used...
Is it possible Dell has a BIOS engineer that doesn't understand the
real world and keeps writing to an old spec?

Oh, and Dave... Using a modem control signal to mux is nothing new.
Remember all the old Radio Shack 'network adapters'? The first one
was nothing but a cassette adapter that let a teacher load a bunch of
TRS-80 computers over the cassette port from a central desk. Then
there was the 'Network II', which was the same thing, but optimized
for the 1500 baud cassette speed on the Model III's.

But the reason I bring that up is the 'Network III'. It was a SERIAL
switch, that let a host control which port the 'teachers' machine would
talk to...

Mike

It dosen't work any better today, than when it was first conceived,
especially on devices that aren't designed for it's presence.

When you have devices, like GPS and TNCs, that output data more or less
constantly, then you have switching occurring in the middle of data, and in
the middle of bytes. If there isn't active error detection, then you get
scrambled data.

I bet you the protocol was something along the lines of slaves responding
to the master. The master could then switch ports, knowing that nobody was

```
supposed to be talking, and that anything coming in right after a switch is
noise.  We don't have any of those protections with the equipment we use.

That's true.  And in the Radio Shack case, the software made it a
'captive audience' so to speak.

With the GPS and other devices, you really need a 'store forward' type
box...

Hmm....  I wonder, just how much data would it have to 'store' before
it would be able to 'forward'...

Mike

>
>Hmm....  I wonder, just how much data would it have to 'store' before
>it would be able to 'forward'...

That's how my serial box works.
I buffer and packetize the data, and pipe it to the host.
Same thing in reverse for outbound data.

As it sits now, I can go up to 8 bytes in a packet. Not too efficient, but
the 115200 link to the host makes up for a lot.

If I port it to MegaAVRs, then I can go MUCH larger, 16-32 bytes per easily.
Ideally though, all the packets are small. I keep whipping through the
ports, and whatever's come in, I ship it out, rather than letting it build
up. Keeps latencies down.

Rendered body type: text/plain

At the suggestion of many I updated to 2.6.1 and still have same issues
running WinAPRS and my TNC.

Hyperterminal communicates with TNC just fine, WinAPRS running and going to
terminal page shows junk. I am using the exact comm 1 settings of baud
1200, even parity, 7 bits and 1 stop - does not work...

Maybe my TNC settings?

I tried turning on KISS mode and going back to WinAPRS still nothing but
junk...

1. Any other (non expensive) ideas?

2. Is any one ising this set up that can tell me what they are using for
settings?

Thank you, I hope to be on the air soon!

Yeah, a couple --

First, in WinAPRS (any version), go into SETTINGS and then SERIAL PORT and verify that you have VHF on port #1 and 1200 BPS. I believe the default is 9600, so there's one possibility. And I know you've already stated you have the settings right, but just humor me and check them. Then check them again!

Once you have that done, close out the TNC port by "un-checking" the OPEN VHF TNC line under SETTINGS. Then re-open it by checking the line again.

Next, go under WINDOWS and click on TERMINAL WINDOW and see if you can communicate with the TNC in that window. Ought to work, unless your TNC is in KISS mode or something, in which case, go under SETTINGS, then TNC COMMANDS, and then VHF -- EXIT KISS MODE. If that doesn't work, try VHF -- EXIT KANTRONICS HOST MODE under the same menu.

One of those ought to get you going...

Precision Mapping 5.0 mapping tools can do address to address trip routing,
but not, IMO, as well as Delorme. Unfortunately, WinAprs hides most of the
PM 5.0 mapping functionality from the user.

Avalailable PM 5.0 features that are missing from WinAprs.
1. Trip or Street address to street address routing.
2. Add new streets to map.
3. Add new Places to the map.
4. Street hints. See street addresses when you move your mouse over a
zoomed in map.
5. Draw map scalebar.
6. Rotate map in direction of travel.
7. Rotate icons in 1 degree steps.
8. North pointing arrow.
9. Save Map to bmp file.
10. Display mapping toolbar.
11. Load underlays (bmp.file).
12. Load overlay files (*.ovr, *.cmx files).
13. and more.

Earl Needham wrote:
> We need a "Swiss Army Knife" program! <G>

Earl has said a very profound thing. Others have eluded to it though I doubt they realized it.

What APRS (and frankly...the whole unconnected-data Amateur data world) needs is a super simple basic development engine with easy plug-in capability. UI-View is close to just such a thing...but misses on several important areas.

Enter: "The UnIversal Engine" (or UI-Engine). It's purpose is to simply "accept" data (from several possible sources), parse it against "the protocol", trap for errors (sending appropriate error messages to some "port") and pass the parsed/trapped information out to another "port" for further processing (ie. display, encoding, transmission, or some other action).

The "tricks" include:

- make *every* protocol parameter user-definable
- allow for users of the engine to select from multiple protocol 'stacks' so that the UI-Engine could be used not only for APRS but also BEACONet and just about any other UI-service that one could come up with.
- be sure to write it with 'standard' hooks so that others could write 'plug-ins' to suite their purpose
  - Multi-port TCP/IP support
  - ODBC support
  - XML support
  - DDE support
  - etc.

Think of this as the "killer spreadsheet program" of the Amateur UI Data World; people use spreadsheets for lots of purposes (a while ago I even designed one that showed polar plots of a phased 2-element antenna array and changed as the phase relationship between the elements changed). The spreadsheet manufacturer simply designed "a development environment" and let the creativity of the individual take it where they needed to go.

UnIversal Engine could do the same thing for Amateur Data Services.

Think about it for a while before just blowing this off as yet another goofy Ev-idea. This is bigger than 'just APRS'. It has the ability to be a testing and development ground for data modes and services that have yet to be designed. You know I'm right. :o)

What I've seen is that if my kpc3plus digipeats a RELAY or WIDE it does not seem to remember that it already digi'ed that packet when it comes around again as a WIDEn-n.
>
> Wes

A-ha! This makes sense to me...especially in the context of APRS where such a personality is not a bad thing.

In fact, it is advantageous to have the first digipeat be 'non dupe-supressing' because the idea of APRS is to have just enough TX redundancy so as to get to the tall-powerful regional digipeaters (at altitude, with good coverage). Once there, the "ether" us much busier and *that* is where the 'non-dupe' algorithm should be used.

Bob said it before...there is very little reason in the year 2002 for APRS Wide-coverage digipeaters to not respond to WIDEn-N and TRACEn-N; and for all mobile users to launch packets as RELAY,WIDEn-N and all fixed users launch as CALLSIGN,WIDEn-N (or just WIDEn-N if direct to a digi). Doing so would 're-unify' the APRS service across the continent for mobile users.

Now...for the radical question: How many wide-area digipeaters do *not* respond to WIDEn-N and TRACEn-N? It would be good to identify just how much of a profile these stations consume... *then* we can talk about what it would take to bring them into 'compliance' with this vision.

Rendered body type: text/plain

I don't want this to appear that I don't think that Dave's serial octopus is not a good idea. It's a great idea, esp for people with laptops. However, it's a chicken and egg problem that's getting nowhere fast, and that's a damned shame. It also has the potential to switch a tnc in and out of stand alone tracker mode if a host is or isn't connected. Tha'ts great stuff!!!

The GPS used with an HSP is a special case... the GPS sends data soooo often, we can afford to miss a few seconds of data, and later pick up where we left off. Other serial devices pose a problem, however, most others have flow control.

Why not an "intelligent" hsp? a 555 timer as a "missing pulse" detector... you simply wait for so many mS of quiet time on the serial line before you allow the DTR signal to switch.... consider it a "zero crossing switch" like one would use in AC power switching ... would go something like this....

1. data is streaming in from TNC.
2. PC asserts the DTR line.
3. 555 timer makes the TNC stay connected to the PC serial port until so many mS of silence on the line is heard. After so many mS of silence, we just assume that we've seen the end of a packet and the TNC is waiting for another to come in over the air.
4. CTS is asserted, stemming the flow of data from TNC.
5. 2nd 555 timer won't allow the GPS to be connected to PC's serial port until so many mS of quiet time.
6. Finally, the GPS is permitted to connect to the PC serial port we hold this state for a while...
7. DTR is un-asserted by the PC.
8. 555 timer drill happens all over again. GPS won't release the line until so many mS of silence.
9. TNC line is silent since we're previously stemmed the flow with CTS. We simply let CTS fall, and tnc sends data if it has any.

Could also be done with a PIC chip (or avr... hi hi dave.) where the PIC chip just switched the serial data lines with 2n3904 xistors. The pic chip would have the job of watching the serial lines for the aforementioned delays and asserting the flow control lines as needed. heck, the PIC could even count the delays in the GPS data stream, and switch auto every 20 or 30 seconds.. or even every second. I know my GPS spits out data every two seconds with nearly a whole second of quiet time on the line between.

Wes

I understand. Thanks for the clarification, Greg. This got my interest because in BEACONet.25 we use a TRACEn-N alias exclusively. The reason was simple: if/when the band opens for world-wide propagation we have, in effect, a v-e-r-y large collision domain. Alternatively, during VHF Contests it is entirely possible to have several hundred people LOS to each other (ok...I'm dreaming on this one...but this aspect of BEACONet.25 operation has yet to be exploited). Anti-dupe is essential to maintaining a channel load that could support the service.

It looks like this was (and still is) a good choice for BEACONet.25 (an AX.25 service that is a "1st cousin" to APRS). Thanks for the clarification.

Warm regards,
Ev, W2EV

Hi Mark,
Were they duplicated at the WIDE3-3 level or at the RELAY level (before the
WIDE3-3 was invoked)?

In other words...if the frame was launched as RELAY,WIDE2-2, and it went through
two different RELAYS to the same WIDE, then this is not really a duplicate
frame, is it?

Sorry...I missed the document (it must have been before my interest in the
thread was piqued <smile>).

Fire your ad agency. They've done you a dis-service :o)

If your system will truly do this it is a good start to what I was describing.
How does it handle the other features that were noted in the original message
such as user-control of each protocol specification and ability to choose
multiple setups?

Okay, JeAPRS is a container architecture that you plug in things that do what
you want to do. I have created pieces and modules that support APRS directly.
There are objects that implement the TNC interface. From this interface
implementation, you can hook up anything using the IO mapping mechanisms. I
created and APRSStreamHandler that you hook 1 or more TNC implementors up to.

In my APRSStreamHandler, you register APRSEventListener objects and/or
streamListeners (that just see the RAW TNC data). The modules that I have
written are all APRSEventListeners and can thus be registered to get method
calls from this interface that returns packets and data objects with the data
objects being unique to each APRS message type.

So, if you want to do non-APRS packets, you attach as an streamListener and
you get the raw data. The APRS parser will ignore the packet if it doesn't
match one of the packet types. Or if there is no APRS needed in your
application, then you can write whatever modules you need and just use a TNC
implementation.

The JeAPRS UI will have the ability to use user defined configs of different
sets of objects with different I/O configurations. I just haven't finished
the work on that yet.

There are some interfaces and classes that have APRS in their name that
shouldn't in the current code base. I am trying to rename things as I have
time. I used APRS in a lot of names because that was the initial target
application. As I refactored some of the code, I neglected to rename in some
cases where I should have.

Understand, I have been working on this off and on for about 2 years, and have
used it for my APRS station when at home and via my IOpener for the past
18months. I even have a version of the code that I dumbed down to run on the
J2ME/MIDP (cell phones) environment, but it has too many classes to run on my
motorola/nextel phone. It does work in the emulator though (as the pictures at
http://www.c2-tech.com/~gregg/w5ggw/aprs show).

It may not do exactly everything you want yet, but my intent was to create a
generic packet radio container that would allow APRS and similar UI protocols
to be experimented with, and in particular allow people to create their own
small custom modules that we can't get the mainstream APRS software programs
to implement because of the small audiences.

Hi Gregg,
I tried to understand what you said...but I couldn't follow it (typical ill informed end-user that I am) <smile>. I'm sorry. You probably used terms that are related to Java programming conventions that are foreign to me.

I followed your link but couldn't find anything to download and try. In fact, the closest thing that I saw was:

JeAPRS - A Java APRS Application Development Environment

Programming API - Comming soon!
Windows Install - Comming soon!
Overview and some Pictures

How would I try out JeAPRS for myself (I may have missed a link)? I'd like to find out how much control I have over the protocol that is parsed and displayed (for instance...the APRS protocol says "All caps", however in BEACONet^31 there is an advantage to using lower-case letters because PSK31 favors them with faster TX speeds).

Thanks for the insights to your product. It sounds like a great step in the right direction!

1076. [aprssig] Dupe Supression [was: KPC3 ID/NOID settings]

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Sun, 30 Jun 2002 21:54:01 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87497-2002.06.30-21.32.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

According to the KPC3+ (ROM 8.2) manual, dupe supression was invoked only for WIDEn-N and TRACEn-N. Even then, each digi has the ability to identify the amount of time it will listen for a duplicate transmission before allowing it to be digipeated.

UIFLOOD WIDE,30,ID will listen for duplicate WIDEn-N frames for 30 seconds after an initial frame was heard. After that expires, it will digi what it hears (even if it is a dupe of one that came 31 seconds ago).

If dupe's are being propagated, the first place to look is the ## setting in the UIFLOOD parameter of the digi that is digipeating the dupes. Maybe that number is too low, given an areas digipeating personality?

Looking over the manual though... I can't find a mention as to what constitutes a 'dupe'. Is it the payload? Is it the UNPROTO? Is it a combination? Can anyone offer any insights here? I'm sure it's been discussed before...it's just my feeble memory at work. :o)

>Hi Gregg,
>I tried to understand what you said...but I couldn't follow it (typical ill
>informed end-user that I am) <smile>. I'm sorry. You probably used terms
that
>are related to Java programming conventions that are foreign to me.

In Java, interfaces are used to describe the contract between the implementation and the user. In a sense, it is like a C++ class that is completely virtual in that it states the signatures of the methods, but is not the implementation.

So, TNC is a specification of the contract between the implementation of access to a UI frame source and the users of that UI frame data.

1078. [aprssig] Re: KPC3 ID/NOID settings

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Sun, 30 Jun 2002 22:27:44 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87501-2002.06.30-22.06.34--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Mark,
I'm looking at the three groups of packets that you received and concluded that Dupe supression was not working. They included the following:

```
===== Group 1 =====
KA5GLX>GPSLJ,RELAY*,WIDE:...payload...
KA5GLX>GPSLJ,RELAY,W5MAY-8*:...same payload...
KA5GLX>GPSLJ,AI5TX-2*,WIDE:...same payload...
KA5GLX>GPSLJ,AI5TX-2,W5MAY-8*:...same payload...

===== Group 2 =====
KC5EVE-9>RY4S4R,RELAY,WIDE3-3:'{3?l  >/
KC5EVE-9>RY4S4R,W5MAY-8*,WIDE3-3:'{3?l  >/
KC5EVE-9>RY4S4R,W5MAY-8*,WIDE3-2:'{3?l  >/
KC5EVE-9>RY4S4R,K5WH-2*,WIDE3-2:'{3?l  >/
KC5EVE-9>RY4S4R,K5WH-2*,WIDE3-1:'{3?l  >/

===== Group 3 =====
W5RRR-7>ID,W5MAY-8*,WIDE:W5RRR-7/R WIDE/D RELAY/N
W5RRR-7>ID,AI5TX-2*,WIDE:W5RRR-7/R WIDE/D RELAY/N
W5RRR-7>ID,W5MAY-8,AI5TX-2*: W5RRR-7/R WIDE/D RELAY/N
W5RRR-7>ID,AI5TX-2,W5MAY-8*:W5RRR-7/R WIDE/D RELAY/N
```

Group 1 and Group 3 appear to be launched via RELAY,WIDE. Giving the Kantronics KPC-3+ (ROM 8.2) manual a quick once-over, I cannot find any reference to Dupe supression when using the aliases of RELAY, WIDE and TRACE. It appears that this is working correctly. In fact, it is a good argument for folks to be using RELAY,WIDE3-3 rather than RELAY,WIDE. In this case, a gentle note to the frame-launching station to ask them to reconfigure their UNPROTO may be in order.

```
This leaves Group 2 for discussion...
                           RELAY      WIDE3-2    WIDE3-1

KC5EVE via RELAY,WIDE3-3 ->W5MAY   ->
                         ->unknown -> W5MAY
                         ->unknown -> K5WH
                         ->unknown -> unknown -> K5WH
```

Unfortunately, because of the implementation of WIDEn-N (in destroying the previous UNPROTO alias), it is difficult to know exactly what is going on. For a test that is more apt to provide you with data that you can better analyze, I would suggest that you change your UNPROTO to RELAY,TRACE3-3 and see what is actually going on. For instance, is it possible that you are within LOS range of a non-call-substituting RELAY digi that is clouding the analysis of your data (knowing that RELAY is not a dupe-supressing alias)?

Regards,
Ev Tupis, W2EV

You might check the Rigblaster site. On Windows ME, this was a problem and they guys at Rigblaster had a link to a site where you could set the serial ports
at boot time. It works fine for me on my ME and might be the fix for your
W2K system.

If you don't have any luck on their site, let me know and I will do some more
digging to see where I had the stuff.

The DTR line on my Dell laptop (running Win2k) serial port is always high for some reason and as a result I can't do direct serial CW keying through a Rigblaster Plus (has DTR LED to show state). Keys my rig continuously. It doesn't appear to be a Rigblaster or keying software problem because DTR is high before or after running the keying software (part of Win-EQF). Any ideas on how to keep DTR low are greatly appreciated!

I am afraid I cannot say I have 'travelled extensively,' and I sure haven't had any 'private communications' with the power that be. I am just a guy living out in the sticks right next door to another country who goes up there on a fairly regular basis (will be getting even more regular since my stepson starts college in Montreal in the Fall!) and with a lot of friends and acquaintances from the other side who come down this way with equal regularity. We don't bother changing Status text every time we go over the border. This is how we do it every day up here ...

Gee, you better stock up provisions and saddle up ... you have several thousand Canadian and American APRS hams up here educate on our regulatory improprieties.

P.S. to my knowledge, in this region at least, no one has ever been cited for operating in this manner and APRS has been very active here for quite a number of years.

Subject: [aprssig] Re: LONG TRIP

Brian,

You are incorrect. Transmitting your lat/lon does NOT meet the identification requirements for reciprocal operation, in this country or any country that the US has an agreement with. The various reciprocal regulations are very specific in what method of identification is required (prefix (XX/) or suffix (/XX) of the host nation, sometimes indicating region or class of license).

AX.25 is not designed to support this method of identification (hence the reason a D7 or D700 does not allow this type of callsign). However, identification can be done within the text of the packet. On a D7 or D700, this means turning status on and putting the callsign with the necessary prefix or suffix in the status text.

I have traveled extensively internationally and operated in CEPT countries, Canada, and Mexico. All of these countries have indicated (via private communication) that compliance with their respective reciprocal licensing agreements are mandatory, inclusive of the identification requirements. The method of identification described in my second paragraph meets these requirements. If you are not identifying your station properly, you are in violation of the reciprocal licensing agreement.

I tried looking in the help files with 2.61, no luck.
I haven't been doing this in a while, sooo...

What do I need to do to set up my Igate again?
I've got the TNC and radio set up already, but I sort of remember a few
tweaky things needed to be done to the standard station.

If the connection of the negative between the radio and the battery is bad, anything can happen, and I do not mean good anythings. I have killed part of a TNC that way when I keyed up from a TNC, and the earth path was through the TNC. What you need to do is look for other earth paths...

I was helping a guy jump start his Holden Commodore and he made sure that I put the negative on the body of the car (on the end of the battery earth strap, rather than the battery since doing that 'can fry the computer'.

Anyway if you look, where can you have another earth path? The common answers are through the microphone, and through the antenna. The antenna shield could support this current if it is not a mag mount... And would be likely to do little harm... Since the cross section of the body would mean little voltage drip. The issue comes with ground paths through the microphone. If you had some type of hands free, or other circuits connected to the car this could cause lots of problems. Othersise I would say it would be a coincidence

Darryl

My D700 is running very nicely with a 2002 Toyota Corolla... The only issue is where to mount the antennas. I will probably mount the GPS antenna in the rear spoiler, and maybe fill the spoler with epoxy, and mount the antenna on it too... We will see

You may be inadvertantly running other software that uses this line as a control
line for an external device. I don't know how W2k shows you what is running
(other than a careful examination of the system tray), but you may wish to probe
there first. Alternatively, maybe a <ctrl> <alt> <delete> will pop up a window
of all software that is running so you can see if there is something unexpected
there?

For example: KG4RII had exactly this symptom with his "RASCAL interface" on
Windows 95. Come to find out, his system was setup to use a UPS, whose control
software was using the line. The funny thing is...he wasn't using that UPS
function (and thought he installed the software correctly [yeah, I know...why
install the software at all?]). After uninstalling the software, he regained
control of the line and all is well ... and he is now the Florida 'anchor' to
this summer's 2-meter transatlantic tests on BEACONet^31 (200-watts, 14 elements
and UI-View on 144.131 USB + 1500 hz PSK31 audio).

With any fortune, this may help you, too.

Regards,
Ev Tupis, W2EV

I would suspect that the TNC was in the Converse mode, not
the CMD mode, when the init string is being sent to the TNC.

Significant dupes are bad, but conversly, APRS depends on a minimum level of dupes to assure redundancy and reliability. On one extreme, too many dupes, cuts throughput but assures delivery. On the other extreme, complete dupe elimination improves throughput but with a significant reduction in probability of delivery.

I prefer not to sacrifice probability of delivery to mobiles and accept dupes. But where to draw the line is the problem. No dupes causes me to worry about what packets I am missing. Two copies does not bother me in the least. Three copies some of the time are not bad. Three copies of every packet are a pain. Four copies tells me there are too many overlapping digis in an area and the network needs to be fixed.

Remember MOBILES have multipath. The probabiliy that a mobile will hear a packet at a given range is probably only 50% or less of a home station at twice the distance. Even the slightest 1 millisecond fade or flutter will kill any mobile's receipt. Having multiple copies of APRS packets WAS PART OF THE APRS DESIGN to get the traffic to the mobiles.

The presence of DUPES does not mean anything is wrong. In fact, I will say that about two copies of most local traffic is PREFERRED in a mobile APRS network.

We should not let the apparent desires of 24/7 home stations over large areas overshadow the network design of APRS which was intended for real-time-local-mobile-tactical-reliable digital communications.

But I agree, I have asked Kantronics to add the UIDIGI process to the same dupe-elimination process used for UIFLOOD. But just dont want people to automatically assume that all dupes are BAD.

This is easy. The WEB page below shows exactly the mix of APRS digis in the USA as of 3 weeks ago.. I will update it in another week or so as more sysops have had a chance to fix some obviously needed upgrades.

http://www.ew.usna.edu/~bruninga/digi-overlays.html

This automated map display is based on the DIGI OVERLAY character which should be on ALL digis to inform users of the capabilities of that digi. Getting all digis to so identify themselves is the first step.

A clarification:  WIDEn-N does not destroy the previous alias, it is the
local sysop's setting of "ID" that destroys the previous alias.  THis is
why we must either encourage those sysops to change back to the way APRS
was designed (NOID) or at least label their digis with the "I" overlay so
users konw which ones are intentionally leaving the "ID" set...

Prince Jokun P. Otonto
NNPC Nigeria

ATTENTION: The President/Managing Director

I am the Director of maintenance for the Nigeria National Petroleum Corporation (NNPC). I have been mandated by my colleagues to look for a foreign organization that would be able to provide an account into which can be transferred the sum of (twenty million five hundred thousand us dollars) $20,500,000.00.
The funds are the excess of an over-inflated contract that was done for the NNPC and are still floating in NNPC�s account with the Central Bank of Nigeria. These funds need to be transferred to a beneficiaries account hence this proposal.
We have agreed that for providing an account you will receive 25% of the funds. For us to proceed we need the following details to process the transfer of the funds:

NAME & ADDRESS OF YOUR BANK
ACCOUNT NAME
ACCOUNT NUMBER

With the above information it will take 7 working days to transfer the funds to your account.
As we are senior officials in our organization we have arranged this deal to be hitch-free.
We also wish that you would in turn keep this business confidential.
Please reply by providing us your private e-mail address, fax and phone numbers for easy and confidential communication.
Please reply at jpotondo@rediffmail.com
Looking forward to doing business with you.

Yours sincerely

Prince Jokun P. Otondo

Hello,
I just installed SA V5.0 and received:
Error:"C;\WINDOWS\SYSTEM\CYBER32.OCX failed to register HResult. Contact your support personnel." I was installing it on a PII with 128 MB RAM and the OS is MS Windows 98 2nd edition 4.10.2222 A
The program runs but, will not go down to street level when used with

WinAPRS V 2.6.1. How can I get the OCX to register?

Tnx & 73,
Dave N0EOP

> WinAPRS V 2.6.1. How can I get the OCX to register?

CYBER32.OCX is not used not with Precision Map Maps AFAIK. I assume this
is used by SA V5.0.

SA uses Delorme maps only and WinAprs can use Precision Map 5.0 and APRS
maps only. The SA installation should have no effect on the operation of
WinAprs with Precision Maps.

WinAprs V 2.6.1 can access the Precision Map 5.0 data if mappro50.ocx is
installed and registered. WinAprs must also be able to access the mapping
data files on your system. WinAprs requires that they be in a directory
named PMap50. The subdirectories Data1, Data3, and States must be present
as well. Data2 and Contour are optional but will be found on the
distribution CD.

Assuming that you have installed and registered mappro50.ocx, have the
Precision Map 5.0 data files available, and you cannot see street level
data when you zoom in, it is almost always due to the inability of WinAprs
to find the precision map 5.0 data files.

You must provide the drive letter to WinAprs of the PMap50 directory.
 Click on 9th button from the top of the toolbar displayed to the right of
the map. Enter the drive letter of the drive that contains the PMap50
directory in the box marked CD-ROM drive and hit ok.

This looks like diagnostic output, where WINAPRS is sanity-checking the packets.

WinAprs reports errors when the packets it receives are not considered to
be APRS packets.

It expects the source call to formatted similar to:.  WA1ABC-15>   W4J* is
not terminated with the > char.  None of the error messages included in the
original email included the > char so WinAprs reported this as a
ParseAPRSLine error.

A line that starts with ? (as in ?EH) would be an invalid 1st character in
a source call.

Ken Brown, W2KB, helped me figure out a minor problem in the Weather
Display feature of WinAPRS 2.6.  So, currently, Weather Display input
to WinAPRS is not working.

We will have this fixed shortly, but it won't be up on TAPR until next
weekend.

In the mean time, if you have the Weather Display program, please let me
know..

I can't seem to get any (I must have found at least 12 URLs) links to the
WinAprs docs to work. Keep getting a page not found error. I can get to any
other URL except at Rutgers for APRS. I can even get to the main site for
Rutgers. If hits was the first time I would just think that the site is
down. But, I have been trying for the last couple of days. Anyone have a
good URL that I can reach? Or, is the site down? Or, can anyone tell me why
I can't reach the site? Are the docs anywhere else but at Rutgers? I need to
read the docs to find the answer to several questions I have.

Tnx & 73,
Dave N0EOP

If you're already running WinAPRS at home, and it's in C:\WinAPRS,
try C:\WinAPRS\Docs\WAPRSdoc.htm

Hi all,

I`m currently trying to get a 2x serial PC card to work in my laptop
connecting a GPS and a Baycom modem.
The card is from www.socketcom.com and has two ports. Looks good.

I have just noticed that the card only can supply abt 3V to the Baycom
modem. Same as for modern PCs.

Old PCs did supply 5V. The "modern" drivers do not.
I have not seen this valuble information when searching about why I didn't
got it to work at start.

Oops. Of course you're right. I just got a little ahead of myself with
assumptions. Thanks for the correction.

Still...the points still seem valid: it's 2002. APRS Wide-area digipeaters
should all support WIDEn-N and TRACEn-N and the 'best' path becomes:

RELAY,WIDEn-N for mobiles
[CALLSIGN,]WIDEn-N for bases, where [CALLSIGN,] is optionally used if needed in
order to reach a WIDEn-N digi

This will assure that everyone gets heard and seen. The continent re-unifies,
the birds will sing and the sun will shine. :o)

First off, 3v should be plenty.  But I have to qualify that.  As best I
can remember, and it HAS been a while...  3V is the SPEC
for RS-232C under the standard load.  (I forget the actual load value,
sorry)

The spec is that the driver MAY go higher, but it only has to maintain
a MINIMUM of +/-3v swings under load.  If it does that, then it meets
the RS-232C standard, which is 'the' standard for these things, last I
heard.

If you have a modem that won't work at 3v swings, then the MODEM is
at fault, NOT your serial card.

However, there is an area where some units fall down...  Symmetry.  I've
seen some systems, modems as well as DTE ends (PCs are generally
'DTE') that can become confused if the swing isn't symmetrical.  I ran
into that when I was using some TI parts.  They got flaky when it wasn't
balanced around 0v.

What can you do if it doesn't work?  Well, you could build a buffer box..

I took a look at the card, and I was impressed.  It may be the answer.

For one thing, the vendor SPECIFIES that the card (I looked at the 4-port
card) can do simultaneous communications but it does it with one IRQ.
They actually claim this is faster (and you could argue it is) but it does
mean only with the right drivers!  But just the fact that they specify it
that
way means they know of the issues.  And I've dealt with Socket.  If they
are still the company I dealt with before, they DO know there stuff with
regard to this.

I'd say it's looking like one heck of a nice card!

I agree, for those with the spare int, and socket to insert it, this does
look like a nice solution.
The only part I don't like is all those cables, coming to a fragile connector.

If you're concerned about ruggedness, then look into these cards:

http://www.socketcom.com/product/serial_dual_pc_rugged.htm

http://www.socketcom.com/product/serial_quad_pc_rugged.htm

The connectors are molded in, instead of the unpluggable variety, and should
be considerably stronger. The quad variety even mentions uses in all-terrain
vehicles, dust and moisture seals, and structural rigidity to resist
overtorquing the card.

In short, unless you're putting this into your Toughbook, your laptop will
probably die before the card.

The 4-port card the cable is rated as durable.  I think it disconnects for
the 2 port card.

As to ints, that shouldn't be an issue at all.  If the socket is CardBus,
it's
totally a non-issue as it's sharable on the PCI bus.  If it's not, you
just have
a PCMCIA socket, then it still only uses ONE interrupt for the entire 4
com channels.

```
Ev-

As you know, those digis running stock TNC-2 (or Paccomm) firmware don't
support WIDEn-N or TRACEn-N and there are those sysops who will not change
for whatever reason.  They may not be aware of or want to use UI-Digi and I
know I don't want a PC up there in the bldg on the Mountain. This is for
the same reason I don't use cheap Kenwood, Icom or Yaesu radios for digis
either.

If you go to LA, just know that only one main digi may respond to Relay. We
should be using WIDEn-N anyway.

And if you come to my neck of the woods you will note that the * will be
shown on the digi that you heard, not where the packet entered. If people
want to know the other, then maybe they will look at the icon on the APRS
map that shows where the station is will give us an idea about where a
packet entered.
The ID/NOID discussion on KPC 3 digis is basically a religious issue for
Bob, and so is the issue of not having a RELAY alias in California. Local
decisions sometimes override what everyone else does for various reasons
that may or may not be explainable or understandable.

So I guess I am just saying that we should count our blessings that we are
all using the same frequency, data speed, and protocol and that the network
works.

Rendered body type: text/plain

Okay, I got pre Maps 5.0 LOADED (and registered). I used it on a recent
trip to Kansas City an it worked fine. The problem surfaced on the return
trip. When I returned home I was watching the stations in my home town.
>From about 19 miles out the stations, including my house were showing up SE
of where they should be, and I mean miles SE of where they should be. As I
got closer, the icons slowly moved back to their correct position. When I
was within 10 miles of home all the stations were located in their correct
position. Has anyone seen this and is there an explanation?

Thanks

John

Dear Dave,
You have nailed it. You have a RELAY,WIDE,TRACE,WIDEn-N,TRACEn-N digipeater.
:o)

So, I'm confused about something. If the digis in LA have the RELAY
function turned off, what happens if you have RELAY as your first label
in your path? Do all the digis ignore you, or do they just ignore the
RELAY and look at the next label?

They will ignore you. That is why it is important to have all the
WIDE digipeaters setup to accept RELAY as well and just the RELAY
digipeaters will be setup for plain RELAY.

It is not as bad as it might sound. There are a lot of APRS stations in the LA basin. Home stations,
that still respond to RELAY. Only the HIGH digipeaters to not respond to RELAY. But I have
RELAY,WIDE2-2 as one path in a low power tracker, and it works just fine around LA. Brent KH2Z

What you've described is a _real_ WIDEn-N digi.  The naming is a bit of a
historical progression.  First there were WIDE digis and RELAY digis, then
came RELAY/WIDE digis when it was learned some TNCs could digi MYAlias and
MYNode.  PacComm produced a TRACE digi (with RELAY and WIDE too).  Then
Kantronics came out with the WIDEn-N digi TNC which could do all of the
above and WIDEn-N and TRACEn-N.  All of these were stand-alone TNCs (as is
UIDIGI, which came later).

Yes, I have seen this problem and I assume it is a problem with WinAPRS
2.6.1.

The problem usually goes away by expanding the screen to "full screen" (at
least as big as it will go which is not too big).  I have found that the
Lists, Stations also does not work unless your window is expanded to max
setting.

Hopefully the Sproul's will fix this problem along with the several others
in their next release.  Especially the one to give us full screen viewing of
the maps.

You don't get out of your backyard!   This is the endlessly debated issue on this sig -- itinerant mobiles using the standard path of RELAY, WIDE or RELAY, WIDE2-2 just don't "get out" in L.A. unless a local home station just happens to be on, enabled for digi, and has the RELAY alias set.

For a while, I had a low-level 25-watt station at my office (which had a very good view of most of the LA basin) running a TNC2 doing RELAY. I noticed it was getting about 1 or 2 hits a minute from out-of-town mobiles that otherwise would never have been heard in the area or igated....

What parts of L.A?    I frequent the west San Gabriel Valley (Pasadena, 
Alhambra, MPK), the Glendale/Burbank/Verdugo area,  and the L.A. west side 
(Westwood, Santa Monica, MDR, etc) .

When I first got my D700 about two years ago, I was frustrated that I NEVER 
seemed to get into the Internet system using the factory default RELAY,WIDE.  
And definitely nothing would happen on I-5 north through Saugus/Newhall/Santa 
Clarita/Castaic [area heard only by Oat Mtn digi]

When I saw the beacon text about RECOMMENDED WIDE2-2 only, I changed the path 
to that and my success rate went up about 1000%.

BTW, the California state fiscal disaster has trickled down to L.A. county. [ 
L.A. County is now a half-billion in the hole. The county, not the state or a 
federal agency mind you!] I got laid off from the  LACO telecomm radio 
systems department (I'm contract, not direct hire) last week.   
    Consequently, I have lost the primo Igate/Digi location with T1 Internet 
service (my office) so WA8LMF-10 is off the air indefinitely!     And I'm in 
the market for some other radio-systems-type work.....

Ah, you are comparing to different things!    RELAY,WIDE  is not the same as
RELAY,WIDE2-2.   The LA digipeaters do not respond to WIDE.  If you get
digipeated via a RLAY, but that is it, then your success in getting to the
IGate is lower.  But RELAY,WIDE2-2 work pretty good.  I set my wife's
tracker to alternate as I said.  Each path also have a different Icon.  It
switches between [1] and [2] making it easy to see which path got
digipeated.  Both paths work find for the San Bernardino/Riverside  to LA
south to Orange county.
```

39. [aprssig] findU problems this weekend

From: Steve Dimse <k4hg@tapr.org>
Date: Tue, 2 Jul 2002 06:03:25 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87700-2002.07.02-05.41.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

While I was out of town for four days (playing road manager for the Deanna Bogart Band at the Reno "BBQ, Brews, and Blues Festival"), something strange happened to findU. When I got home, both my primary and secondary servers were loaded with more than a thousand excess processes, coming from the javAPRSSrvr and the weather alert processor. I still don't know why this happened, but the result was a bogged down system which made it all but impossible to get pages from the server, and blocked a lot of incomming data. The system has been fine through the night after restarting the java application and disabling the weather alter processing.

Until I figure out what happened with the weather alerts, that feature will be unavailable, all other features on findU should be functioning normally, let me know if you see any problems.

Steve K4HG

Rendered body type: text/plain

Hi Ralph,
What an excellent post you made, by the way. It really does alot to help the newer folks on the list to understand why there are such divergant configurations around the continent.

The ID vs. NOID discussion is an interesting one, as it depends on what one wants the system to do as to if one or the other should be used. Unfortunately, whatever should be used...really should be used everywhere in order for meaningful examination of packet texts to be possible.

My comments were really intended to get us to think a bit about cataloguing what the APRS system's netork had in it now (a snapshot, if you will) as far as digipeaters that are and are not capable of processing WIDEn-N requests. It would be nice to know the extent to which it is even an issue (I hate spending time slaying non-existant dragons <smile>).

The idea of digi's responding-to or not responding-to RELAY is one of those choices that I see as good for a local group to make. *If* there is a large density of stations in an area that are RELAY enabled, this makes sense (uh

oh...I've just stumbled on a problem that I'll float to the APRSpec list shortly
-- an alternative to the icon overlay proposal for digi's that may provide more
detailed and useful information for viewers).

Anyway...well stated, Ralph. It will be interesting to see just how many of
each type of digipeater is out there.

Regards,
Ev, W2EV

42. [aprssig] If my radio had a really short TXdelay...

From: "Wes Johnston" <wes@johnston.net>
Date: Tue, 2 Jul 2002 07:15:38 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87704-2002.07.02-06.53.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If my radio had a really short TXDelay (like 6uS), I could send a beacon
from my digi every 100mS, and that would seem like an eternity to the radio.

I could fake out full duplex by rapidly switching between transmit and
recieve.

Imagine how many trackers we could support if we could transmit 100's of
packets on a network per second.

Imagine what a movin map would look like if each station checked in every
second.

Ohh wait, I just got my 802.11b accesspoint in and it does all of this....
<grin>

Wes

They do not skip the RELAY. That would be nice, and may even be in
development. I am going out on a limb, but I think Mike Musick's pocket
digi was doing something along those lines: "fixing" badly designed pathd.

If it is still as I remember, there is at least one and maybe more than one
strategically located machine in an area that will eventually hear you.
They do publish what path is recommended for the area. The locals should
already either be using WIDEn-N or the closest digi addressed by specific call.
The area is saturated. There are many many reople usong APRS and using it
incorrectly.   Paths being used were crazy, sometimes with multiple RELAYs.
Until you have been there (you cannot imagine how much of a nightmare it is
to even get a packet in edgewise.

Even I don't live there, and I am amazed whenever I meet with the local
APRS gurus- what they have to deal with.

On Mon, 1 Jul 2002, Ralph Fowler wrote:

> If you go to LA, just know that only one main digi may respond to Relay.
```

Now that is a good idea.

In otherwords, since their problem is that too many DIGIS in LA hear the same packet, they have turned off RELAY in ALL of them. But if they instead, looked at the big picture and just made sure that at least one digi in range of everywhere would respond to RELAY, then the system will still serve the mobile user passing through and they have helped reduce the dupes...

Great idea Ralph...

Bob

well if it is in a location like n0zed-5 , it won't last , I replaces the wind cups 3 times before I gave up , seem like a peet 500 cant handle 140+ mph winds and sub zero temps at the same time ,
I you do , best to send the weather info every 30 min or so

It would be *terrible*... lol... your WX would have to travel one less hop than it does now, maybe even ONE hop. Honestly, I can't see anything wrong with the idea at all. If memory serves me correctly, I think Ralph Fowler said something about doing this a few years ago.

I have received a lot of great comments, but I should have provided more information about the high profile digi because some of the comments assume that the digi is located on a remote mountaintop. The digi (WA1LOU-15) and the weather station are on top of a mountain, but they are located in my house, not at a remote radio shack.

Thanks for all the comments,

Stan, WA1LOU

Our local digi (K4ROK) is up and running with a weather station. It works very well! (It is down for reprogramming and maintenance at the moment). It is nice having a dual purpose station.

73s,
Eric KF4OTN

On Tue, 2 Jul 2002, George Kammerzell wrote about a WX at a digi:

> I you do , best to send the weather info every 30 min or so

But such weather is useless. A good routine is something like the following:

  one packet DIRECT (no digis) every 5 Minutes...*
  One WX packet via adjacent digis only when it changes....*

* APRSdos decays the time period between WX packets if there is no change to TEMPS and RAIN and a percentage of WIND SPEED. THus, unchanging weather is not redundantly transmitted too often.

Bob

512M exactly.  I've set the memory.txt file to allocate 131072
Past 32768, I'm not showing any improvement in the number of stations in
the station list when I start seeing the "out of memory" messages.

>You might consider connecting to a server that will limit the area of
>coverage so that you are not bombed with stations.

Shouldn't be a problem, I've still got 200M free according to the system
monitor.

>Or, you can run Afilter and limit it yourself!
>You can download AFilter at www.wa6oft.com

Seems a shame to DL all that data, then toss it.
Wasteful of server loading as well.

I'm set way higher than that, but past 32768 it dosen't go higher than 4096
stations.

I'm not getting any errors, other than the "out of memory in station list"

I was under the impression that this was how it was anyway: ONE of them was
always supposed to respond.
That's why I never could understand what the big deal was.  If that isn't
how it is, then I have been wrong the last 2-3 years.
The replying digi might not be the highest or best situated, but the idea
was to at least get a packet out somewhere.

Maybe Greg Noneman can enlighten us as to what ended up happening.

Weather sensors mounted much much higher than average ground level give less than accurate readings... the wind speeds, wind direction, and temp are not indicative of proper ground readings....

A great web site that is very illuminating on these (and other WX station site issues) is:

http://www.users.qwest.net/~crb5/

If the WX data is to be useful for forecasters and thier numerical prediction programs... it needs to meet NWS standards.... otherwise it's interesting... but largely usless data....

Ok.. My stations is at 131072. Messages was 8192, your packet buffer is
MUCH larger than mine was (65536), and I did not have destroyicons set.

I'll see what happens with that.

BTW: 2.61 does not have an auto-reconnect button that I can find, like
older versions did, to set auto-connect to the network.

Only reason I can think of not to do it is that the location is so
unique (read high and out of the weather patterns) that the weather
data doesn't mean much to anyone that would decode it. But I have no
clue if or if not that is relevent.

One thing you can do if your concerned about RF footprint is have the
WX PTT also drive the rig to low power, like maybe with a relay or
something. This is assuming seperate WX TNC and DIGI TNC of course. Or
even with the same TNC I guess you could monitor the WX serial line and
use that to control the low power relay.

I think Stan means use the same transmitter.

Nothin' was said about puttin' the wx station on the tower.
Wx station have a stanadard height above a specified terrain
in a white box with louvers.

profile APRS
> digipeater.

Only reason I can think of not to do it is that the location is so
```

```
unique (read high and out of the weather patterns) that the weather
data doesn't mean much to anyone that would decode it. But I have no
clue if or if not that is relevent.

One thing you can do if your concerned about RF footprint is have the
WX PTT also drive the rig to low power, like maybe with a relay or
something. This is assuming seperate WX TNC and DIGI TNC of course. Or
even with the same TNC I guess you could monitor the WX serial line and
use that to control the low power relay.

> I think Stan means use the same transmitter.

Yeap, that is what I assumed as well. Most transmitters have a power
level control on them that could be selected if he wanted one
transmission to be "lower profile" then another (if that was his
concern). The weather device could select this through a simple relay
or PIC circuit.

> Nothin' was said about puttin' the wx station on the tower.
> Wx station have a stanadard height above a specified terrain
> in a white box with louvers.

He said he was on a mountain, hence one could assume any amateur class
tower would be insignicant compared to the height of the mountain.
Hence, the weather being monitored would be the weather on the
mountain. My point was is this information useful to most observers? I
have no opinion, just trying to discuss the gentlemen's question (which
by implication was one of channel utilization aka high profile data
source).

Jeff, you have opened up an interesting can of worms...  unfortunately, I can't
figure out how to implement it with my tracker's icom 281.  I suppose I could
install a power amp and drive it with 5watts, and switch it on/off as needed
for low and high power.  But for the most part that comes at the expense of
TXDelay.

For the sake of saving bandwidth, and as an experiment, I have programmed my
wife's tracker to have two different paths and two different beacon rates.

Path 1 has no digipeaters in it.  It is simplex only.
path 2 has the usual path like R,W,W3-3 or something like that.

Path 1 has a pretty high beacon rate
Path 2 is slower.

I'd love to lower the power for path 1 to say, 5 watts and have path 2 on
50watts.

In case anyone asks, the reason for the "simplex" no path beacon is that I got
tired of "leap frogging" her on my kenwood when we drive someplace together in
different cars.  The kenwood does not support dead reconing (I don't fault it
for that at all).  Ideally, I'd like a high beacon rate with an effective RF
range of like 1 mile, tops.  5 watts is as low as the icom 281 will go.

Heck, here's another idea for the smart beacon PIC for the kenwood rigs... the
kenwoods send out their s-meter reading over the serial port.  Perhaps it would
be possible to adjust the output power on your kenwood as needed based on
```

stations in close proximity to you.

Now that is a good thing in particular if it can be linked to a transmission packet from a specific station.

>Perhaps it would

Tim Shepard did a Phd Thesis paper on this I believe, might even be on the TAPR web site. The idea being that any mesh network (like APRS) is infintely scalable with power management.

But getting back to your point, are you saying that if you hear a particular "RELAY" station as a certain signal strength you can back annotate your power level to only run enough power to hit that particular station? I think this would be a very good thing for any second generation design of a Amateur AVL/Mobile data network. In fact, one could make a strong case for it just based on the Part 97 rules (using the minimum required power). And interestingly enough, this is actually codified in the FCC rules for Eb/No for the spread spectrum rules (Eb/No is a energy per bit level, similar to S/N ratio).

While one could implement it with present day APRS transmitters (lets say high =50 watts, low = 5 watts) that 10db of difference is not enough. I'd think one would want at least a 50db dynamic range, lets say levels of 50, 5, 0.5W and 50 and 5 milliwatts.

That is not necessarily a true statement. Fire Weather, for example, uses different specs than the typical NWS and this is documented for RAWS stations, etc. There are also world standards that are different as well. Just depends on what the user of the data is looking for. NWS is only one user. Differing specs do not make for useless data. Those that do collect the data understand this.
However, a weather station should follow, to the best of it's ability, the specification that is used by the end user/s of the data.

> just made sure that at least one
> digi in range of everywhere

There is no single digi in range of "everywhere"!!!

The greater L.A. is a sprawl of 18 million people in an area about 100 miles across spanning all or parts of 5 counties stretched over, under, around, and through no less than 5 mountain ranges 2000 to 7000 feet high. The City of L.A. alone is cut in half by the 2000' high Santa Monica Mtns that are topped by the famous Mulholland Drive with it's spectacular scenic vistas.

It is possible to drive from being heard by 5 digis to being heard by none in a space of only 5 miles or less.

For example, the L.A. county sheriff's dispatch system uses simulcast with 17 transmitters on different mtn tops at the same time to achieve only about 70% coverage of L.A. county alone. Not to mention the populated areas of the adjoining Ventura, Orange, San Bernardino and Riverside counties that comprise the greater LA area.

For decades, everyone in the two-way radio business from outside the area (the FCC, the major radio systems vendors, APCO, etc) has failed to understand how extraordinarily different (and difficult) radio systems design and spectrum management is here due to the geography, population distribution and climate.
For example the FCC's formulas for co-channel milage separation rules (for commercial radio users) are totally meaningless in a place where a station at 3000 feet elevation in the mountain foothills can report an antenna elevation of 100' AAT (above average terrain) because it averages the 6000 foot mountains to the north with the sea-level basin to the south.

70. [aprssig] FW: combining a digi and a weather station

From: "Ray McKnight - WB3ABN" <shortsheep@worldnet.att.net>
Date: Tue, 2 Jul 2002 11:40:35 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87766-2002.07.02-14.18.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If you can do a reasonable job in "siting" your sensors, there's no reason why this wouldn't be a good idea. When you say "high profile", I assume that means a "wide" digi? Or at least a digi with good coverage, lots of traffic? From the standpoint of the weather data, the reporting interval or frequency of its broadcast should have little if any impact on the digi's ability to do "digi things". Looking at it from the other way, the digi may be too busy at times to allow the wx station to broadcast, but certainly it won't be delayed significantly. A weather observation remains valid until the next reporting interval. I would think it wouldn't be delayed more than a few seconds.

There have been a few responses containing incorrect assumptions. Some said "don't do it" because you're on a high mountain and your weather observations won't mean anything to the rest of us on "ground level". Or your wind readings are useless because they're not taken at the standard observation height of 10 meters. YOUR OBSERVATIONS ARE VALID FOR YOUR LOCATION - PERIOD. People without knowledge of forecasting make the assumption that weather only occurs at the ground. In fact, in forecasting you always start at the "top" and work your way down. The upper atmosphere causes the weather at the ground, it doesn't start down here and work its way up! You actually can measure wind more accurately on the top of a mountain because you don't have surface obstructions causing interference. If you're reporting winds from an 8,000 peak, which is very useful in validating wind models at various stages in the upper atmosphere.

I believe Bob said that if your observations were 30 minutes old, they're useless. Just not true. Maybe they're not relevant to a pilot landing an airplane, but they're still useful in establishing trends. Too many people believe that weather observations have to be instantaneous. There's a time and place for this type of observation. For fixed APRS wx stations making routine, scheduled observations the "instantaneous" concept has little merit. If your goal is to track tornados, fine, but let's not confuse routine observation with severe weather tracking.

It was also wisely noted that you should strive to adhere to NWS guidelines in observation and reporting. However, this is almost impossible due to the built-in limitations of all the hobby-oriented weather stations. You cannot program them to adhere to established sampling intervals, apply the necessary algorithms, nor cause them to produce data at intervals other than what has been programmed at the factory. APRS weather clients do not have the ability to control these functions. We have to live with these built-in limitations, and use the data with the knowledge of how it was observed and reported. Strive to site your sensors correctly to obtain the most accurate readings; that will be your greatest challenge and make the difference between useful data and just more APRS noise.

1) It'll fill up D700 message memories causing people to gripe

2) Assuming the "high-profile" digi is on a mountaintop: Is anyone (except
skiers maybe) interested in the WX at the top of the mountain instead of the
areas below?

Just playing devil's advocate.....

Let's not take things out of context and read between the lines. Sure,
there are lots of different specifications and protocols. We're talking
APRS here, and in the U.S., where Stan lives, we need to adhere to NWS
guidelines. Which, BTW, are derived from WMO specifications used around
the world for surface and aviation weather observations. NWS adopts WMO

almost verbatim. But as long as we know NWS guidelines, we should also
be aware of any differences with WMO as well. There's no reason to
confuse the issue by introducing all the other protocols, as they are
not relevant to APRS.

73. [aprssig] APRSdos update

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 2 Jul 2002 14:51:54 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: aprsnews@tapr.org
Message-ID: <LYR842-87772-2002.07.02-14.30.20--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have updated APRSdos somewhat: APRS852.zip ASTK-EXE.ZIP and ADAT-EXE.ZIP.
These are the few tweaks:

1) MAPS-PLOTS-POWER command will show PHG circles that are HALF the
   previous size due to MOBILEs having drastically smaller range due to
   multipath and fading. Use MAPS-PLOTS-FIXED command to see the normal
   ranges for fixed stations (like it was before)..

2) APRSdos has always set the decay-down-to net-cycle-time proportional to
   the length of your path so that by default, APRSdos at events or local
   applications would use more frequent (10 min) updates, but that longer
   paths would assume a more regional application with longer timing
   periods to reduce QRM according to the following table...

```
   10 Mins:  Direct
   10 Mins:  DIGI                or WIDE1-1
   20 Mins:  DIGI1,DIGI2         or WIDE2-2
   30 mins:  DIGI1,DIGI2,DIGI3...or WIDE3-N or greater
```

Problem was, up until NOW, the WIDEn-N were not counted, so a path of WIDE3-3 by itself would be considered a one hop path with a high reporting rate... This is now fixed.

3) Added KB2SCS's LOOKUP.EXE to the distribution so that if you want to find all about subject XXXXX in any of the dozens of README files, just use LOOKUP.EXE.

Just what cell phones do! What we call an "S-meter" they call RSSI (Received Signal Strength Indicator). The transmit power of a cell phone handset is throttled back based on the carrier level it is hearing from the cell site.

How will it fill up a D700's message memories? When a WX station sends out an updated WX report, the D700 just replaces the old data on that station with the new. The WX stations don't send messages. At least the ones around here don't. :)

73s,
Eric KF4OTN

1) It'll fill up D700 message memories causing people to gripe

2) Assuming the "high-profile" digi is on a mountaintop: Is anyone
(except
skiers maybe) interested in the WX at the top of the mountain instead
of the
areas below?

Just playing devil's advocate.....

I'm not intimately familiar with the WX reporting formats; I just remember
threads on this list about a year or two ago that were a heated discussion of
this very thing.   Though now as I think about it I think it was hurricane
bulletins, not routine WX reports that were at issue.

> 1200, even parity, 7 bits and 1 stop - does not work...
>
> Maybe my TNC settings?

1) Is the TNC actually outputting data to the computer at only 1200 BAUD?
Although the on-air data rate over the radio is 1200, usually the link
between the TNC and the computer is set much faster -- 4800 is common in APRS
circles since that is the standard data rate used by GPS receivers.

2) TAPR-type TNCs (i.e. MFJ-12xx series) continue to perpetuate the archaic
7-E-1 data format (7-bit "classic ASCII" data with even parity) by default.
This was the most common default serial port communications setting in the
mini-computer era of the mid '70s when TAPR packet was born.
Today, it's a pain-in-the-neck anachronism. APRS was born in the PC era
of the late '80s when 8-N-1 parity-less serial comms had become virtually
universal. Most APRS programs expect 8-bit data and want the TNC set to 8-N-1
(8 data bits and NO parity). 7-E-1 means the 8th bit is abitrarily being set
high or low based on the combined value of the first 7 bits.   Many APRS apps
will choke on this "garbage" data.

    [Note that setting the serial port mode in the program only affects the
PC's serial port -- not the TNC at the other end of the cable!   To change
the TNC's settings means either setting dip switches on the TNC or sending it
commands from a terminal program on the PC]

HyperTerm AUTOMATICALLY recognizes and accomodates both 8-N1 and 7-E-1 so
monitoring the TNC with it wouldn''t make this difference obvious. While in
HyperTerm, get the TNC into the command mode if it isnt there already, and
type the commands:

```
"8BIT ON  <return>"       [ tells TNC to leave 8th bit as-is on incoming-from
air data]
      and then
"AWLEN 8 <return>"      [tells TNC to leave 8th bit as-is on outgoing-to-air
data]
      and then
"PARITY 0 <return>        [tells TNC to not add parity bits to the stream
coming out the serial port.
```

If the TNC's backup lithium battery is in good order, these settings should
stick. However, I like to leave the battery unconnected so I can completely
clear the TNC of invalid settings when some program screws it up by removing
it's power. In this case, you will have to enter these settings each time you
start.

 [The battery-backed parameter settings are also a vestige of the 1970s and
early '80s when people were connecting TTY machines and dumb ASCII terminals,
not computers, to TNCs. Today, with PCs able to automatically and
effortlessly stuff initializations into the TNC every time you start a
program, sticky settings are much less important.]

You can add these lines to the TNC initialization file that WinAPRS reads
each time it starts.

It is also possible to actually hack and modify the TAPR firmware in the
EPROM to make 8-N-1 the automatic power-up default; I have done this to all
my TNC2 and MFJ TNCS and is a real convenience.

That's hardly arbitrary. It's an exactly defined standard.
It is however, archaic.

Valid word lengths used to be as small as 5 or 6 bits, and parity could be
Even, Odd, Mark or Space. Stop bits of 1, 1.5, and 2 were also used.

Today, most anything should be capable of 8N1, and I would be surprised to
see a TNC set to 1200 or below. 9600 or 4800 make a lot more sense.

I prefer 4800, since it is the same as NMEA GPS units, but Kenwood got us
with the TH-D7 that's 9600 only.

> > just made sure that at least one
> > digi in range of everywhere has RELAY enabled...
>
> There is no single digi in range of "everywhere"!!!

My use of the term "everywhere" was meant to mean in "relative sense",
that is, relative to ZERO which is my current understanding of how RELAY
is supported in LA... My understanding was that ALL RELAY capability had
been disabled in all of the LA mountain top digis. THus RELAY would not
work anywhere unless you were near a home digi (a very rare occurance).

In that context, it makes sense to me to judiciously turn on the RELAY function in a selected subset of non-overlaping digis so that the function of RELAY still works somewhat for travelers, but that the duplication problem of too many RELAYS is eliminated... Further, once this subset is figured out, it doesnt hurt to enable WIDE at those sites too..

I would think that with the topography out there, that such a subset would be easy to find... SO my use of the term "everywhere" was not appropriate. WHat I meant was "a reasonable area". Again, this is not expected to be thorough, but to give a modicum of coverage for the default RELAY,WIDEn-N visitor.

Rendered body type: text/plain

Can anyone tell me why this packet didn't make it though AFilter to go to the IS? It was heard by my IGATE and for whatever reason didn't make it to the IS because AFilter didn't like it and rejected it.

```
WA4SAS-8>BEACON,PCSAT-1*,KF4OTN-1,I:!3505.52N/08055.52W#HELLO FROM
FORT MILL, SC
```

I would like to know so that either I can fix the problem on my side or I can get WA4SAS to fix it on his side so his packets are correct.

Thanks,
Eric KF4OTN

83. [aprssig] Re: PCsat Load test

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 2 Jul 2002 17:33:30 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org
Message-ID: <LYR842-87804-2002.07.02-17.11.20--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

On Thurs, 27 June we conducted a user LOAD Test on PCSAT:

> ...Before it goes back into maximum ecllipses, I would like to load
> PCsat with as MANY different users as we can. Target is TOMORRW.
> THURSDAY AFTERNOON, GOING HOME RUSH HOUR, USA, 27 JUNE 2002

RESULTS: A Qualified success. With a user load of 56 simultaneous users, the success rate was over 97%, thus validating the viability of the PCsat and other Space digipeaters (ISS) as a means of letting a large number of users share a satellite during a pass.

DISCUSSION: But it was still not a full load test, since the digipeater was still only lightly loaded (maybe 10% of design load). The design goal of PCsat was to be able to support on average about 300 to 500 users per day in the USA... The following are the details of the test.

SUCCESS: 30 out of 31 with the correct settings were successful (97%)

LOAD: 16 others were trying (QRM) but had the wrong digipeater callsign because PCsat reset in Eclipse and was not properly configured. Of these, one station reported transmitting every 12 seconds throughtout the pass in frustration. Compared to the requested nominal 2 minute rate, he counts for an added channel load of 10 more users... for a total of 56.

The desired transmit dutycycle per user was to be one packet every 1 or 2 minutes. Most users appear to have adhered to that objective and still were able to achieve success.

I am sorry that PCsat was not available during Field Day due to run down batteries. Maybe then we could have seen how the design would have worked with a full load of several hundred users. PCsat is still usable in the afternoon sun, but not in the morning or at night due to not being charged up. PCsat is running out of battery power and resettting itself every eclipse.

If we make it to the next full sun period in September, maybe we can try again to get a full user load to valideate the design...

Thanks for all your participation.
Bob Bruninga

> I prefer 4800, since it is the same as NMEA GPS units, but Kenwood got us
> with the TH-D7 that's 9600 only.

The TAPR TNC-2 and many clones won't do 9600 reliably with the stock
op-amp used as an RS-232 interface. There are several drop-in
replacements, such as the TL-084 which have better performance. Many
years ago there was a mod published in PSR describing how to achieve
19200.

The default EPROM locations for most of the TNC-2 parameters for
version 1.1.8 firmware were published and appear in the revision I made
to the TNC-2 system manual at ftp://tapr.org/software_lib/tnc/tncdocs.zip.
If one has access to a PROM reader/burner, it is a fairly easy task to
change many of the defaults, such as going from 7-E-1 to 8-N-0. I
don't know about any of the other versions or clones, however.

Some of the TNC-2 clones use different circuitry and firmware and will
handle higher speeds and 8-N-1 without modification.

Rendered body type: text/plain

Eric,

You have 2 AFilter sessions running and both have the distance filter set
to within 150 miles of 3534.80N 07718.93W

```
KF4OTN>APAF27,TCPIP*:=3534.80N/07718.93W- AFILTER 2.7.0 07/02/2002 22:22:12
KF4OTN-13>APAF27,TCPIP*:=3534.80N/07718.93WI AFILTER 2.7.0 07/02/2002
23:22:05
```

WA4SAS-8 (3505.52N 08055.52W) seems to be more than 150 miles from KF40TN.
 I tried to verify the actual distance with WinAprs 2.6.1 but the distance
measuring function seems to be broken.

I do not think anyone is taking anything out of context, but your statement
here raises some concerns.
How many APRSWXNET weather stations do you really think meet the NWS
guidelines (not protocols)?
I'd put a bet out there that at least 60% of them do not meet the guidelines
and for very simple and obvious reasons. And really, the number is probably
more like 90 % of them do not meet the spec to the letter.
However, I think that many of them are closer to meeting the specification
of other Mesonet stations such as the RAWS stations and after reading both
specs, it is clear to see why.
I would much rather follow the RAWS specs for a remote weather station.
Certainly, I do not have the property to meet the NWS specs you refer to. I
doubt many do!

Well, none of the hobby weather stations in use will likely ever meet
ANY of the specifications exactly. The fact that NWS is getting a data
dump from the APRS stream every 15 minutes makes it imperative that we
following FMH-1 as closely as possible. Individual wx station operators
99.x%+ of the time have no means to change anything about how their
stations sample, interpret, format or report the data. It's hard coded.
That's the way it is, and it stinks, but realistically it's probably
magnitudes better than every APRS wx station doing it how they think it
should be done. At least now we know the protocol each station and each
APRS client uses, and NWS is aware of that and the limitations of the
system. They automatically QC our data and reject unreasonable values.
If each APRS operator had the ability to make up their own mind as to
which protocol to follow the data would be useless to everyone except
the few who were aware of the protocol in use. Those unaware would take
the data at face value without the knowledge that it may be vastly
different than what they expect - THIS IS DANGEROUS.

I think you might be confusing station siting guidelines with reporting protocols. We report to NWS. NWS expects us to be using FMH-1. FMH-1 is a subset of WMO. If you don't follow that as closely as the hardware and software will permit, then you shouldn't be participating in the Citizens Weather or APRS Weather program. If you interject an odd protocol into a standardized system, you MUST make the others aware of what protocol you're following for the data to be useful. Otherwise, it's likely to just be rejected.

Again, NWS is aware of the limitations of our systems and takes that into consideration. HOW you install your sensors is the biggest variable of the equation. NO automated system is perfect, each will have some compromises in either their location or how a sensor is sited. We should do the best we can, and strive to educate ourselves to improve our data. But let's not even consider playing musical chairs with protocols.

The cell base station's antenna pattern is carefully adjusted to cover a very
precisely defined service area with minimal overlap with adjacent cells.
Often this involves actually tilting antennas downward slightly (either
physically or electrically) so the beam runs into the ground only a few miles
(or even just a few thousand feet in dense metro areas) from the tower.

The handset's pattern on the other hand is unpredictable and somewhat omni,
with it's shape changing randomly as the user holds it different ways. The
power foldback in the handset TX minimizes interference with adjacent cells
and, perhaps most importantly, increases the battery life.

Perhaps you've noticed that some of the new ham hand-helds now have menu
options for RSSI-driven power cutbacks -- no doubt a fallout of using IF
subsystem chips with RSSI output pins originally developed for cell phone
use.

That's exactly how I did it! When I accidentally discovered the table of default values/locations in the manual, I immediately realized I could get rid of this initialization nuiscense once and for all.

I determined that the same hex sequences appeared in about the same place in ROM images of Ver 1.1.9 and several versions of MFJ's modified TNC2 firmware. I made 8-N-1 versions of those also.

BTW, an absolutely marvelous tool for hacking ROM images is the shareware utility editor UltraEdit from:
    http://www.ultraedit.com

This may well be the ultimate programmer's editor. Once installed into Windows, you can right-click on ANY file with ANY extension and force it to open in UltraEdit. Anything that appears to be non-text automatically opens in the typical split screen with a 32 chars/line hex dump on the left and the ASCII literal equivalent on the right.
      When you open text files containing any common language (Basic, HTML, C, C++, etc) it highlights the language's keywords in contrasting colors and flags syntax errors characteristic of that language. You can edit the language definitions yourself so if you want to add the keywords for PIC assembler, or Stamp Basic you can.
       You can do complex find/replace operations either in hex or ASCII text, and it can do them across MULTIPLE FILES in the same directory all at once.
      It's tabbed interface lets you have multiple files open at the same time. It handles conversions between DOS, Windows/ANSI, Unix UTF, and EBCDIC text formats efortlessly and automatically, and also handles double-byte-per-character UniCode character sets.
      It has an incredible number of features that you can go on discovering for months, but the basic operation is so intuitive you can use it immediately without cracking the help system.   Definitely worth several times the $40 shareware registration..

For hacking EPROMs, it's abiltiy to do block mark/copy/paste operations on the hex side of the screen makes it very easy to, for example, combine the contents of two 27C256s into one file to burn into a 27C512. [This is how I have been making UI-DIGI/TAPR 1.1.9 "double-decker" EPROMs for the MFJ 127x TNCs.]

One thing to note:  The GPS should be connected through a 10K resistor to
the DB-9 side of R14, not the chip side.  That wouldn't stop transmissions,
however.

BEACONet lets you look at the world in ways never before imagined.
http://go.to/BEACONet

RIGblaster - LapTops with USB but no Serial Port

So you got a brand new LapTop computer and when you went to connect it to your
RIGblaster you discovered there was no Serial Port.   Since then you have been
forced to run in VOX mode and then only if your radio has VOX.   Well now we
have a solution for this problem.   West Mountain Radio now offers a USB to
Serial Port Adapter by IOGEAR, Model GUC232A, which will allow you to connect
the RIGblaster to that new LapTop.   It is available on our website
(http://www.westmountainradio.com) for $34.95.

Look under RIGblaster Accessories on the Pricing & Ordering page of our Web
Site.

```
I think I need to clarify a few points I made regarding your comparison
of RAWS and NWS guidelines in relation to use on APRS.  If you look
closely at the RAWS protocol, specifically the reporting intervals,
sampling rates, and algorithms used to derive averages and other
standardized values, you will note that basically NONE of these
parameters match NWS protocols.  And for a very good reason.  The two
```

programs have entirely different goals. Obviously, as you have pointed out, sensors are sited in much different configurations.

Siting a wind sensor on the side of a hill at 20 ft versus a level field at 33 ft will produce vastly different results. Rightly so, because the wind field that each measures is aimed at the most representative value for the intended use. General forecasting and fire susceptibility need to measure different parts of the air column, and this earth/air interface has been exhaustively studied and debated to find the most appropriate measurement method. Conversely, when NWS places a met buoy in the water, sensors are at levels optimum for that goal - or at least the data can be properly interpreted by knowing how it was measured.

Also consider that average wind values for RAWS are derived from a 10 minute sampling interval, whereas NWS uses a 2 minute interval. These are the "algorithms" I referred to. Preprocessing of raw data to conform to the reporting protocol. RAWS does it differently than NWS. Even the reporting interval is different, likely optimized in RAWS for satellite reception (too often it's too costly, too little might be too late)

So these are some good examples why we just can't start swapping protocols. The algorithms hard coded in all hobby weather stations are for NWS standards based on FMH-1 (even though NONE match it perfectly). They can't be changed by the end user (us). This is what we need to use. APRS client software would have to be completely revised to accommodate RAWS protocol, even IF it was determined that RAWS was more appropriate for routine surface weather observations, which it isn't.

The goals of the two programs are different, that's why the methods are different.

I do not think anyone is taking anything out of context, but your
statement
here raises some concerns.
How many APRSWXNET weather stations do you really think meet the NWS
guidelines (not protocols)?
I'd put a bet out there that at least 60% of them do not meet the
guidelines
and for very simple and obvious reasons. And really, the number is
probably
more like 90 % of them do not meet the spec to the letter.
However, I think that many of them are closer to meeting the
specification

of other Mesonet stations such as the RAWS stations and after reading
both
specs, it is clear to see why.
I would much rather follow the RAWS specs for a remote weather station.
Certainly, I do not have the property to meet the NWS specs you refer
to. I
doubt many do!

Jim, WA6OFT

Rendered body type: text/plain

There appears to be a conversion problem when entering lat & long in
AFilter 2.7.0

3240.40 / 11425.31
If entered as DDMM.MMMM/DDDMM.MMM this is what the query sends:
APRSWESTX>APAF27,TCPIP*:=324024.00N/1142518.60WI AFilter 2.7.0 07/03/2002
04:45:04

32.6733 / 114.4219
If entered as DD.DDDD/DDD.DDDD it is correct.
APRSWESTX>APAF27,TCPIP*:=3240.40N/11425.31WI AFilter 2.7.0 07/03/2002
04:49:51

This is what the Utilities formula shows in AFilter.

32 40' 24" N 114 25' 19" W = 32.6733 -114.4219

32.6733 -114.4219 = 3240.40 N 11425.31 W

The AFilter documentation states:
Station latitude and longitude can be entered as DD.DDDD or DDMM.MM. The
reload button must then be pressed before the new settings are registered
with AFilter. AFilter checks the validity of entries, and if no entry
errors are found, the latitude and longitude are displayed as DD.DDDD. See
the Utilities tab to convert between other location formats.

If the reload button is not pressed after entering DDMM.MMMM then AFilter
will send the location incorrectly as you indicated.

Yes, exacto. And when you hit the reload button, it also gives you the
option to clear the distance filters. Otherwise, the new settings can cause
problems in position reporting, and may be rejected in some applications.

```
Dick,
 Clearing the distance list has no effect on position reporting other than
to require that all stations supply new location registrations within the
newly defined distance filter before AFilter will pass packets of all types
from them.

Positions that pass the distance filter, and subsequent packets from that
station are not modified in any way.  Therefore, I can't see how the new
settings in AFilter can cause some applications to reject packets passed by
AFilter.

Rendered body type: text/plain

```
There are roughly two different kinds of digipeaters.  Those that
cover a wide area and those that don't.  The digipeaters that cover a
wide area are the ones that you want to get into because they get
into other wide are digipeaters and thus carry your packet further
and further.  These digipeaters answer to the WIDE in your protopath
(via commands).  The RELAYs are stations that carry your packet to a
WIDE if you can't access a WIDE directly.  They relay your packet
into the circuit.

There are also commands like ECHO which is the same as RELAY, except
it is used on HF.  GATE is usually seen on the HF side and when heard
by a Gateway station moves the packet from HF to VHF.  SGATE is
usually seen on SATCOM (PCSat, ISS, etc) to move a packet from the
Satellite frequency over to the 144.39 VHF frequency.

The WIDE3-3 commands that you see work like WIDE,WIDE,WIDE.  Only it
is shorter and doesn't take as long for the modem to put them on the
air.  Whenever a wide digipeater hears the Widen-N, it reduces the N
by one so it won't continually be propagated out all over the place.
```

Hopefully I haven't confused anyone with this explanation.

73s,
Eric KF4OTN

104. [aprssig] APRS WX stations

From: "Alan Heaberlin" <amh@QNET.COM>
Date: Wed, 3 Jul 2002 08:44:47 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-87932-2002.07.03-11.22.41--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There may be no better use of APRS than for reporting weather observations. Tracking capabilities of the network are of course the primary use of APRS but because of the vagueries of the network sometimes trackers just don't track. Weather on the other hand is stationary and the transmitter, antenna and path can be optimized for the best efficiency.
Several kinds of users have need for weather data which can be described as instantaneous or historical (30 minute old data is historical). Weather forecasters are the top of the weather food chain and every effort should be made to report data which is useful to them. Fire weather, especially in the conditions we face here in California and all over the drought-ridden southwest is another primary use of weather data and again, accurate data is imperative. Outdoor recreation enthusiasts have an abiding need for good weather observations. Recreational pilots and skydivers are always interested in wind at several different altitudes. Nearly anyone that ventures past the couch and the front door needs good weather data.
I have a couple of weather stations in close proximity (10 miles apart) and they almost never report the same data. One being at Mojave, often listed as the windiest place in the US. Having several close-by weather stations helps validate the data though, since sometimes our amateur weather stations are prone to glitches in weather instrumentation, radio/tnc or computer. One of the things I strive for in building APRS WX is bullet-proof reliability. Since the only way to determine which is the best going out there in equipment available I am testing everybody's.
In order to put useful data on the network there are a couple of parameters that should be observed as closely as possible. Putting your wind sensor in the clear is helpful. NWS specifications call for the sensor to be 10 meters above the ground and 300 feet from any obstructions. In a home station this can be problematic but if you get it up as high as you can the lateral obstructions will be minimized somewhat. I have a portable station (for testing and remote observation) that has the wind sensor at 7 feet. It is amazing how much different it reads from my home station at 33 feet high only 100 feet away!
Keeping your temp sensor and humidity sensor in a radiation shield (or at least out of direct sunlight) is helpful in recording accurate temperatures and dewpoints.
There is getting to be an abundance of good quality, relatively low cost equipment out there that is being designed for APRS usage. Frankly I haven't discovered any of them to be of the Mil-Spec quality that I'm looking for, but by constructing much of my own equipment and using the best off the

shelf stuff I can find, I'm getting close. I'm getting ready to put some
solar-powered weather stations in the desert to support some wildlife
projects (Bighorn sheep water guzzlers) and this will be the test of
reliability of the equipment--weather and radio both.
While it is most useful to have your weather station reporting data where
people are living, working and commuting, high level WX digis are useful to
the forecasters (and weather nuts too). There are some pretty impressive
winds when you get above 5000 feet and we should know about it.
APRS has allowed me to merge my two favorite hobbies into one interesting,
innovative and useful project. Everybody should have a weather station on
their APRS digi.

Rendered body type: text/plain

Important note: If your path list has an invalid element in it, like:

RelaT,wide,wide3-3 then you don't go anywhere, because noting is going to
respond to "relat"

Also if you have "relay,wide,wide3-3" and there isn't a "relay" that hears
you, then you still go nowhere, even though there may be a "wide" a mile away.

Most digis will respond to relay, or wide, or widen-n, but there are still
some areas out there that haven't upgraded for various reasons, and I
understand that you can't find a "relay" at all in the LA area.

Round here, we're trying to use APRS (and SSTV) to assist with Skywarn
ops.   APRS has made some strides lately, notably WAPRS261 which finally
handles dead reckoned weather objects in a rational manner. :)

```
The problem is probably that you've posted more messages than the search
page would return.  By default, that's 50.  You can go further down the
page and select up to 1000 records in the return.  You might also try
including a year (starting maybe with 1994 and working your way up) as one
of the search terms.

Rendered body type: text/plain

```
Now that ISS is again doing packet, and APRS is welcome,.... I caution
everyone not to overdo it.  Seeing your duplicated packet many many
times makes you look bad and APRS look  bad.  One guy (not APRS) was
transmitting every 10 seconds!

Also the BBS is again active and everyone is arguing over who gets to use
it.  The ARISS receommendation is still to not use it.  Leave that for the
crew and the VIP stations.  Remember these guidelines:

1) Dont operate unattended (or set one packet every 5 mins if you need to)
2) If attended, and a 50W Mobile, I would transmit no more often than
once every three minutes.  If a D7 HT with only 5W, I might do 2 minutes.

Your goal is not to QRM anyone else, but to get your packet in at least
once on the pass so others can see you and or QSL or contact you...  Same
for Messages.  One successful digipeat and everyone will have seen it...

de WB4APR@amsat.org, Bob

Message-ID: <LYR842-87977-2002.07.03-19.26.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

New option added --> Find Igates. Enter a callsign, for which a position is known, click the callsign option, and then click IGate. Or, enter the Latitude and Longitude using a "/" character as a separator, click the Lat/Long option, then IGate to search by Lat/Long. Example N34 / W117. Or, enter a Grid Square, click the Grid Square option, and the click IGate. The default range is 50 miles. You may need to increase this distance for more remote locations.

If you only know part of the callsign of a station, enter the portion you do know, click the Data button and a list of knows stations will be returned that contains that portion of the callsign. Use one of those callsigns to do a Near or IGate search. Example, Enter KH2 and a list of stations the KH2 prefix will be returned, then click on the link of one of the returned stations to perform a Near search. Then click the IGate button to perform an IGate search. Note, Entering a partial callsign of WB4 for example, may return a large amount of data, so please keep your searches reasonable.

Feedback always appreciated. Thanks

Brent Hildebrand, KH2Z

Know Where Web page update:
http://4.46.81.200

The DNS on http://kh2z.lynxstudio.com is not currently working.

New addition - Track data. In position reports, if the background color of a line of position data is gray, then there is track data available, click on the station's Icon to retrieve track data. Currently it is returned as the raw data. Time is the number of seconds since Jan 1, 1900.

Brent KH2Z

Hello All,

Is there a program or a way to break this packet down into LAT / LONG?

```
K5LPS-7>SURW5U,RELAY*,WIDE:'}ECl v/]"8%}
```

This is for friend traveling to the great Southwest.

Thanks in advance,

Hi Reid,
What you are about to read is full of generalizations, but it's accurate enough for your level of experience in the APRS world. Take the time to understand the below, and lurk for a while. We're more than willing to help.

RELAY and WIDE are called "path aliases" and appear as shown below in each APRS packet:

```
WD4RBX>APRS,RELAY,WIDE:...payload...
```

In the APRS world, the launching station is in control of how their packet is relayed throughout the APRS network. Hence, the term "Path". Each station in APRS is also given an "Alias" or alternative identification...in addition to their callsign. This "Alias" is usually RELAY or WIDE or TRACE or WIDEn-N or TRACEn-N or GATE or ECHO.

The above example is WD4RBX requesting that anyone with an alias of RELAY digipeat the packet frame. After that, anyone with an alias of WIDE should digipeat the frame.

Every APRS station should respond to a RELAY request. Only 24/7 stations at altitude (usually called stand-alone digipeaters) should have an alias of WIDE.

In the above example, WD4RBX wants anybody within range to digipeat his frame (with the hope that doing so will relay the signal to a 24/7 digipeater at altitude). Once that is done, then the 24/7 digipeater will (should) hear the packet and re-broadcast it over a much wider area.

Specifically...let's assume that W4AAA is another local station that is at a home and K4ZZ is a 24/7 digipeater at altitude. There is no difference between the following, functionally from WD4RBX's perspective):

```
WD4RBX>APRS,RELAY,WIDE:...
WD4RBX>APRS,W4AAA,K4ZZ:...
```

This is because W4AAA is a home station that responds to RELAY (as an alias) and K4ZZ is a digipeater that responds to WIDE.

Let this soak in for a day or so and ask more questions. I'm sure others on the list will chime in to help you to understand a bit.

Kind regards,
Ev Tupis, W2EV

This packet is a Mic-E packet. All of the APRS software available today
decode this sequence. You can manually decode it by downloading the
APRS specification from www.tapr.org and reviewing the Mic-E chapter.

Ev, Bob, et al.-

What about those of us running D700s mobile with the option to digi? Should
the D700 respond to relay as well (especially in a highly-congested area
such as Dallas)?

Also, are there any plans to evolve to 9600 baud one of these days, since traffic congestion seems to be getting steadily worse?

Thanks,
Terry

The kenwood d700 is an exception. It can only "be" one alias at a time. You
can make it digipeat WIDEs or RELAYs, but not both. 'most all other TNCs
have the space for 4 or so aliases.

Wes

Since I'm running mine mobile, I don't think Wide is a good idea... the
question is, should I digi RELAY packets, or not digi at all? I do activate

the digi function when I'm out in the surrounding counties and need to help
other mobiles make it into a wide (for instance, during RACES events, I
will turn on the digi so that other members have a better shot at making it
back to an Igate.

Any individual group or area can create their own APRS cell using any frequency
and any baudrate.   The key is to have at least one Igate bringing their packets
in to the core servers.

The Seattle area currently has two supplemental cells. One of a pair of
  digi's on 440 with a nice quiet channel so it's acceptable to run
mobile beacons with a much faster transmission rate.  The other "cell" is a 9600
baud digital repeater used primarily for TCP/IP traffic.   The local APRS traffic
is barely noticeable on a faster system without the overhead of digipeaters.

73,
Bill - WA7NWP

I don't think that's entirely true. It supports one alias and the UIFlood stuff. However, my understanding is that you have to set the UIFlood stuff via an attached computer.

Note that I don't have one so I'm relying on information from the manual, a knowledgeable owner, and testing prior to a recent field event.

I will note that Kenwood did one really, really smart thing in their implementation of UIFlood. In addition to ID and NoID they support a third version "First". It does callsign substitution only if it is the first digi to digi a packet.

Hi Terry,

The first line of my e.mail mentioned that the information contained below was full of generalizations and this is one of them...

> >Every APRS station should respond to a RELAY request.

In fact, there are some home-based stations that don't respond to RELAY either...because a while ago there was a version of their software that failed to make that happen automatically. The authors have since changed that, but knowing how slowly we tend to upgrade I'd bet there are plenty of folks out there that are using the old one.

Additionally, 'dumb trackers' (mobile APRS stations that only TX their GPS-locked position without the ability to RX first) can't respond to RELAY either. etc.

However...the vast majority of APRS stations *should* respond to a RELAY request.

As for 9600 baud, there is very little reason to 'migrate' to it. Studies that include all the factors involved, including the ability for a transceiver to T/R and PLL to frequency-lock quickly, as well as the higher power required for the same S/N ratio -- and finally, the generally (there's that word again <smile>) poor 'Bit error rate' of today's amateur transceivers at 9600 baud point to little advantage to 9600 baud APRS...and actually show a significant advantage to 1200 baud APRS along with spending significant effort in cleaning up the existing 1200 baud digipeater network.

This points back to the discussions that erupt from time-to-time about assuring that all digipeaters be capable of supporting the WIDEn-N alias (which only causes minor conflict between opinion staters) and invoking its NOID parameter (which can be a source of significant discussion).

Most APRSers view WIDEn-N as a more efficient use of spectrum than its equivalent WIDE alias when repeated an equal amount. For instance, launching a packet as RELAY,WIDE3-3 is generally viewed as much better than RELAY,WIDE,WIDE,WIDE. Hence, the push to get everyone, everywhere to switch to RELAY,WIDEn-n.

Regards,
Ev Tupis, W2EV

>What about those of us running D700s mobile with the option to digi? Should
>the D700 respond to relay as well (especially in a highly-congested area
>such as Dallas)?

If RELAY was available and people ran 5 watts out, there would be little problems. FM capture effect would keep the mobiles from getting into multiple RELAY digis in congested areas and provide a self policing duplicate controls...

The 50watt mobiles and 100watt home stations are the ones that are making dupes appear everywhere that RELAY is supported...

Yes, one alias, but dont use that. Use the UIDIGI command in the D700 and you can have four or more!

But again, DONT use it except for very special applicatiosn. The danger of forgetting that it is on and then saturating a network with unneeded and unwanted repeats is far worse than the added benefit of a roving short-range mobile digipeater.

And once set, It seems to remember its settings even after you remove them. A real sleeping bomb.... <== MORE RESEARCH NEEDED please)

Hello Alan and group,

I want to put up a APRS weather station. I have lots of old weather stuff. An old Heathkit (Davis) 8 bit card with sensors and software. A Kantronics KTU. Tons of packet equipment.

I also am not happy with the quality of the outdoor sensors. From what I have read lately, and that's not a whole lot, a company Texas something-or-other has a nice APRS compatible unit.

I would like to see what you come up with, please keep me in the loop. If nothing else, this message is to show you there are others wishing to work with you and put some time and money into the project.

APRS soon in the mobile. (KPC-3+, Alenco DR-1500, Garmen 50)

Thanks, Shanon KA8SPW

To: TAPR APRS Special Interest Group
Subject: [aprssig] APRS WX stations

There may be no better use of APRS than for reporting weather observations. Tracking capabilities of the network are of course the primary use of APRS but because of the vagueries of the network sometimes trackers just don't track. Weather on the other hand is stationary and the transmitter, antenna and path can be optimized for the best efficiency.
Several kinds of users have need for weather data which can be described as instantaneous or historical (30 minute old data is historical). Weather forecasters are the top of the weather food chain and every effort should be made to report data which is useful to them. Fire weather, especially in the conditions we face here in California and all over the drought-ridden southwest is another primary use of weather data and again, accurate data is imperative. Outdoor recreation enthusiasts have an abiding need for good weather observations. Recreational pilots and skydivers are always interested in wind at several different altitudes. Nearly anyone that ventures past the couch and the front door needs good weather data.
I have a couple of weather stations in close proximity (10 miles apart) and they almost never report the same data. One being at Mojave, often listed as the windiest place in the US. Having several close-by weather stations helps validate the data though, since sometimes our amateur weather stations are prone to glitches in weather instrumentation, radio/tnc or computer. One of the things I strive for in building APRS WX is bullet-proof reliability. Since the only way to determine which is the best going out there in equipment available I am testing everybody's.
In order to put useful data on the network there are a couple of parameters

that should be observed as closely as possible. Putting your wind sensor in
the clear is helpful. NWS specifications call for the sensor to be 10 meters
above the ground and 300 feet from any obstructions. In a home station this
can be problematic but if you get it up as high as you can the lateral
obstructions will be minimized somewhat. I have a portable station (for
testing and remote observation) that has the wind sensor at 7 feet. It is
amazing how much different it reads from my home station at 33 feet high
only 100 feet away!
Keeping your temp sensor and humidity sensor in a radiation shield (or at
least out of direct sunlight) is helpful in recording accurate temperatures
and dewpoints.
There is getting to be an abundance of good quality, relatively low cost
equipment out there that is being designed for APRS usage. Frankly I haven't
discovered any of them to be of the Mil-Spec quality that I'm looking for,
but by constructing much of my own equipment and using the best off the
shelf stuff I can find, I'm getting close. I'm getting ready to put some
solar-powered weather stations in the desert to support some wildlife
projects (Bighorn sheep water guzzlers) and this will be the test of
reliability of the equipment--weather and radio both.
While it is most useful to have your weather station reporting data where
people are living, working and commuting, high level WX digis are useful to
the forecasters (and weather nuts too). There are some pretty impressive
winds when you get above 5000 feet and we should know about it.
APRS has allowed me to merge my two favorite hobbies into one interesting,
innovative and useful project. Everybody should have a weather station on
their APRS digi.

FWIW - I personally will never spend another penny on Cushcraft. They
have absolutely the worst customer service of any company I've ever
dealt with and their products are not properly supported. Some are just
plain junk, but they refuse to acknowledge customer complaints or
provide support. Don't believe their claims that everything is SS
(stainless steel), isn't true, most is just plated.

They love to take your money, but won't answer the phone or their e-mail
or even certified letters. Replacement parts are criminally expensive
IF you can ever get them to send them to you.

I've since taken down, sold and/or sledgehammered all my Cushcrap antennas. Wouldn't have another if my life depended on it.

Sent: Thursday, July 04, 2002 12:20
To: TAPR APRS Special Interest Group
Subject: [aprssig] Questions for WB4APR and the group

I've just joined the group so I'll be doing some reading to catch up, but I
do have a few questions for WB4APR which might be answerable by others.

First, I sent WB4APR a check for APRSData registration over three weeks ago
and have yet to see it cleared. I sent an email to WB4APR@amsat.org but

have not received any response. I'm assuming that you are either very busy
or your amsat.org email might not be getting to you. Either way, its not a
big concern. I just want to make sure it gets there. Concerning
registration, will that particular registration number work if I download
future versions of APRSDOS, Data, and TK?

Second, for WB4APR's and everyone else's information, my APRSData server

(AD5ER) is on for the Amarillo area. I haven't fine-tuned the .POS files
yet (I especially want to configure the voice repeater file, but it will

take some time and research), but I am sending out APRS and FM voice
satellite schedules. Its running just fine on a very old PC hooked up to a
D700, which is temporarily in my house (and not in my truck where it
belongs) until I get a TNC to use with my Icom 207. I don't get very many
queries, but maybe its presence will motivate others to get involved with
APRS and satellites.

Third, I also use APRSTK, and like it very much, but it will not go into

DOZ mode. When I hit F10, it displays the following error:
"Illegal function call in line 0 of module ASTKW at address 052D:4E32 Hit
any key to return to system", and after hitting a key it dies.
Am I the only one that has experienced this?

Fourth, I've been able to send and receive to ISS and PCSat (although PCSat
seems to be weak lately), but I have yet to hit UO-22. I can receive the
occaisional bulletin and a few APRS positions from it, but using the path
of UOSAT5 I can't get any response. I have my APRSTK hooked up to a TH-D7
and a roof-mounted Arrow dual-band J-Pole. Will I require more gain and/or
power to reach UO-22 or am I not configured correctly? Also, what's the

deal with NO-45?

Finally, although its a bit off-topic, has anyone heard anything good or

bad about Cushcraft's dual-band yagi antennas (A27010S or A2706S)? The
bigger model looks like it would be able to out-perform Arrow's dual-band
yagi satellite antenna, but looks can be deceiving, so I want to get a
non-Cushcraft opinion. I'm considering either the Arrow or the Cushcraft
as a satellite antenna mounted on WB4APR's simple antenna rotator system,

and also occaisionally for terrestrial, long-range work (voice and
packet).

Any input on the above questions would be greatly appreciated. Thanks
for
your time, and have a good 4th!

Brandon

An Automatic Instantaneous APRS DF network:

On Sun, 30 Jun 2002, Wes Johnston wrote:
> Here's the first draft of the smart beacon for kenwood d700 and basic stamp

Imagine this. If a Jammer or stray signal appears, an APRS station sends out a packet reqquesting signal strength on the indicated frequency. All D700's (with the PIC processor) instantly QSY and take a signal strength reading on the indicated frequency and then report back the signal strength heard.

Since APRS knows where all the D700's are, it instantly gets a signal strength coutour from which the location of the signal is then usually obvious. APRSdos has always had the ability to plot overlaping singal strength contours with brighter colors showing stronger signals. The area of maximum overlap of the brightest colors is where the signal is coming from.

See the plot: http://www.ew.usna.edu/~bruninga/dfing.html

>From Inception in 1992, I always thought 3rd to GPS and WX, that the most important capability of APRS was in turning DFing into a group sport or automated process. We have the graphical display tools and the formats lets use them!

Wes, how quickly can a D700 QSY the BAND-B, take a signal reading, and then get back to the original frequency it was on? My thoughts are that this should be able to be done in a tenth of a second or less and so the user of the radio would hardly notice that his radio was being used by the APRS-Automatic-DFing network?

In fact, one could develop modified PIC code fore any programmable radios and use some of these older radios at home stations to also contribute..

Any other PIC programmers looking for a job?

Other people may be interested, so I'm responding to the list. Feel free to respond privately if you want to discuss it more.

If ArcView can export ESRI Shapefiles, Xastir can read them in. The code still has to be fine-tuned to each individual Shapefile format, but it can be done. If you copy one of the formats that we already have coded up, you're all set. We can currently use some files from NOAA, and Tiger/Line files converted to Shapefiles from one of the ESRI sites (that gives us maps that look a _lot_ like the TigerMap online server).

Xastir runs on Mac OS X, Solaris, FreeBSD, Linux. One guy reportedly has it running under Cygwin on Windows as well.

I can also snag out Garmin waypoints and tracks using a development version of GPSman (not released yet), and write them out as Point and Polyline Shapefiles that can be read in by Xastir.

These are all open-source programs: $0.00

Bob, I left my stamp at work... so I can't test right away... but i can tell you that the kenwood sends a LIST statement each time it hears a valid aprs packet. The contents of the LIST message include the comment or status text. If the query were placed in the packet in such a way that it appeared in the LIST, then it is simply a matter of making the radio QSY.... I think 10mS is a bit of a stretch, but certainly the time from QSY / measure/ QSY back would be less than 100mS.... this is an awesome thing!!! I have to learn how to compose a message via the serial port and send a packet as a message back.

The basic stamp sx is ideal for this (as would a 16f876 or avr be), as opposed to the stamp 2. The stamp 2 does not have any input buffer, and the SX has a 100 byte scratchpad ram area where serial data can be temporarily stored.

Boy, this is a great idea.... Your aprs station sends out a DF request for 146.52mhz, and every kenwood radio in the area sends back a signal strength reading. The map back at home lights up within 30 seconds. wow.... I worry about collisions, and I worry about flutter if the d700 is travelling down the road.

> What about those of us running D700s mobile with the option to digi?
> Should the D700 respond to relay as well (especially in a
> highly-congested area such as Dallas)?

In my opinion, the D700 UIDIGI should remain OFF in all routine operations. But ON (with ONLY RELAY) when specifically needed:

1) If parked on a hill and the area is poorly covered
2) Going to Dayton and on the open road in poor areas
3) At your special event where you ARE the digi (set as needed)

CAUTION!!!!! If you EVER put "WIDE" in the UIDIGI list in your D700, it appears to remain there for ever. Even after you remove it. This is still an unverified report, but it bears more testing. The only way to get rid of it apparently is to resave the list with NONE to overwrite it.

In other words, once you activate your UIdigis be very observant about what your rig does from then on. Mine just seems to keep digipeating at the wierdest times. I havent had time to troubleshoot, but hopefully someone will figure it out. Anyway, leave it OFF unles you have a specific short term need.

> Also, are there any plans to evolve to 9600 baud one of these days, since
> traffic congestion seems to be getting steadily worse?

Wont help much. A 9600 baud stand-alone single packet is hardly any shorter than the 1200 baud very compressed packet format used by the Kenwoods. Thus the savings is not even a factor of 2, yet the RANGE performance is 4 times worse...

THough This area is certainly open for RESEARCH!

140. [aprssig] Great Plains Super Launch reminder

From: "Mark Conner" <n9xtn@cox.net>
Date: Thu, 4 Jul 2002 09:46:52 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88054-2002.07.04-10.25.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This Saturday, a collection of APRS-equipped balloons will launch from central Kansas for the second annual Great Plains Super Launch (GPSL).

On Friday, a symposium will be held at Kansas State Univ. with several speakers on amateur-balloon-related topics. Saturday morning, as many as 7 balloons will be launched from the Herington Municipal Airport (about 7 miles ENE of Herington, or 70 miles WSW of Topeka.

At least 6 of the balloons will have APRS on them. Most of the APRS activity will be on 144.34 MHz, and I-gate support for this frequency will be provided by WA5RRN in Topeka.

Look for the following callsigns: N9XTN-11, N9XTN-12, W0WR, W5VSI-11, KA0JLF-11, WB8ELK-11, KD4STH-11.

The launch time should be between 1230 and 1430 UTC on Saturday, and the flights will last 2-3 hours. Expected track is to the NW about 10-15 miles.

The GPSL web site is at
http://users.crosspaths.net/~wallio/GPSL2002.html

>them.  A real sleeping bomb.... <== MORE RESEARCH NEEDED please)
```

We discussed this with the Hamhud, and came up with a simple system that would convert any mobile into a portable wide, IF it was outside a settable range of any other wide, then "demote" itself when it comes into range.

The value in being a wide, as opposed to a relay, is that anyone near the portable wide gets to not only use the mobile's better transmit, but also it's ears.

An interesting side effect, is that if an area's wide is taken out by a storm or whatever, then the local vehicles set themselves up as wides, but NOT excessively. Why this is, is that any individual station will demote iself, once it discovers that there is another wide covering the area. Within a few packets, everything settles down, and you have a working net. When the real wide comes back online, all the mobiles demote themselves again.

Here in the Pacific North West, we encourage D700 owners to leave their digipeating capability shut off!

It would just add to the bandwidth and NORMALLY add nothing to our NW APRS system. However, there are times when you might want to activate your D700 digi capability. This could be utilized in a SAR (Search and Rescue) operation or a special event like a bicycle race, where you are in a remote area and are not able to hit any of the normal digi's. This was the main reason why I "had to have" a D700. Of course I have had no regrets in purchasing one. I can park my truck on a high point in the search area and help the low power hand held trackers make it back to base camp.

The other time that I can think of turning digi on is when I am hiking or backpacking in a remote mountainous area with my D7A where I can not hit our APRS network. By having my own portable digi at the trail head, I have a good opportunity to make it out to the rest of the world. I do use APRS to let my wife know where I am and how I am doing. Great tool for communication when voice repeaters are not in range!

I was thinking of a MESSAGE format. Does that come out the serial port?
Then it can respond to either a group command or a directed individual
command...

Wait a minute .. I'm confused about paths.

Assuming a packet is addressed to APRS VIA RELAY, WIDE.

I have been told by a very knowledge person on this SIG that if a WIDE digi hears that packet -- EVEN IF A "RELAY" DIDN'T RELAY IT -- it will still digi the packet because it sees its alias (WIDE) in the address. In other words, if a WIDE hears the packet direct from the sending station, it will digi it -- it doesn't need to hear the packet from the RELAY.

I think I've seen replies to the SIG saying a WIDE won't act on the packet without a RELAY* sending it. Anyone know for sure?

73 and Happy 4th!

A digi with WIDE as an alias, or with WIDE set up in UIDIGI, will NOT respond to a packet with a path of RELAY,WIDE unless the RELAY has already been "expended".

In other words, you were told incorrectly.

There is software "in the works" that will allow this to work -- I believe it's called "pre-emptive digipeating", but it isn't out yet. Or, at least, it isn't in general use anywhere.

Definitely not true.
I had my path in my HT set to KC6ETE-9,Wide,Wide3-3
When I beacon, ETE-9, and ETE-3 (local wide, KPC-3 WRT digi) both digi me.

Then I changed my first path element to KC6ETE-8, which does not exist.
So the path is now KC6ETE-8,WIDE,WIDE3-3
Now nobody digis me.

>  In other words, if a WIDE hears the packet direct from the sending
> station, it will digi it -- it doesn't need to hear the packet from the RELAY.

With my front path element set to RELAY, I get digi'd by ETE-3, because
it's a Relay, Wide, Trace digi.  Some are, some aren't.

>I think I've seen replies to the SIG saying a WIDE won't act on the packet
>without a RELAY* sending it. Anyone know for sure?

Definitely not true.

Unless it's a KPC-3 set up as a relay, wide, trace digi.
AFAIK, everything in the TAWG area is set up this way.

KC6ETE-3 will definitely digi on Relay, Wide, WideN-N, Trace, or TraceN-N

If you send a packet via RELAY,WIDE it must be relayed first by a station with an alias of RELAY or it won't be relayed at all. That station may also respond to WIDE and other alias's but the RELAY must be used first. Once it has been transmitted by a RELAY, then RELAY is ignored by any station that receives the packet later and only the WIDE is active.

Each time any station digi's a packet a flag bit is set on the alias that it responded to (signified by the '*' after the call/alias) and the next call/alias in the path becomes the active one. All entries in the unproto path except the active one are ignored. Multiple digis in an area can cause the same packet to be flying around with different active unproto path entries. This is what causes dupes, a certain amount of which is beneficial to ensuring a packet gets out.

No. That's called Pre-emptive digipeating.   Normally the digi's must be in order. First the RELAY, then the WIDE.   In Pre-emptive digipeating, one path entry preempts the earlier ones.

Only Digi_ned, and the very latestest UIDIGI, can be configured to do this.

>
\>THough This area is certainly open for RESEARCH!
>
\>de WB4APR@amsat.org, Bob

That has nothing to do with 1200 vs 9600 - it's the hardware being used. Good
9600 baud radios can run with Transmit delays in the range of 50 milliseconds
or less.   Typical 1200 baud radios should work well in the 300 to 350 millisecond
range.   Thus the 8 to 1 speed improvement of 9600 to 1200 is maintained.

On the other hand, setting up a 9600 baud system is significantly more effort
then 1200 so it can be argued that low throughput applications like basic APRS
would not be worth the effort.

73,
Bill - WA7NWP

Yes it is true. Dave, you're thinking about the way it is around here - all
WIDE digis respond to RELAY. In S. CA, that's apparently not true.

The bottom line is SOMETHING must respond to the RELAY first. It may be a
home station, it may be a digi that's also a WIDE, but the RELAY is first.
Until it's used anything after it is ignored like it wasn't there. At
least, as Earl said, that's the way it is until smarter digi software appears.

```
I was asked how many digi's are running UIDIGI.

Since we know that UIDIGI 1.7 using the TOCALL of       APZ17
                and   UIDIGI 1.8 uses either            APZ18
or the just assigned                                    APNU18

is there an easy way to tell using FINDU or one of the other parsing programs?

Dave

>Only Digi_ned, and the very latestest UIDIGI, can be configured to do this.

>Bill, WA7NWP

And Digi_Ned does it very well.

Digi_Ned can also function as a smart RELAY in an area that has RELAY
turned off.

>all WIDE digis respond to RELAY. In S. CA, that's apparently not true.

I did make the point that the digi that I'm testing against is an WRT digi,
and that some are not.
However, it IS true that a WIDE will not respond to a packet with a path of
RELAY,WIDE.  An WRT WIDE however, will.

>The bottom line is SOMETHING must respond to the RELAY first.

Absolutely.

K0RX (Mt. Vernon, IA) has a nice MicroWeather system
http://www.qth.com/RXcomm/

This systems supports the Dallas Semiconductor 1-Wire station, which is now
produced by TAI, a Mexican
Information Technology company. TAI has been an OEM developer for Dallas
1-Button solutions for 10 years. Their headquarters is in Querétaro City
(Mexico), and the company offers hardware and software products based on
Dallas Semiconductor's iButton® technology.

http://www.aag.com.mx/weather.html

The units are still $ 79 USD and secure orders can be placed on their web
site.

Automatización Aplicada a Gasolineras S.A. de C.V.
Pino Suárez # 271 G Col.Niños Héroes
Querétaro, Querétaro
76010 México
Tel/Fax +52(442) 215-3166 / +52(442)215-3336
E-mail: infoaag@aag.com.mx

With the Web-addressable components of the 1-Wire® technology, this
instrument kit allows, a very economical way, to measure temperature, wind
speed and wind direction, by the way of only one wire (plus ground) , with
only the power supplied by the RS232 serial port of the PC

Well. The facts remain.

A plain old "WIDE" digi will not respond to "RELAY". They still exist.

The more modern, Wide, Relay, Trace (Or WRT digis) will respond to Wide,
WideN-N, Relay, Trace, or TraceN-N.

It's in keeping with the general aprs philosophy that one sort of settings
should work everywhere, except where it dosen't.

:)

160. [aprssig] Questions for WB4APR and the group

From: "Brandon Cole" <brandonacole@yahoo.com>
Date: Thu, 4 Jul 2002 12:19:51
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88068-2002.07.04-12.57.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've just joined the group so I'll be doing some reading to catch up, but I do have a few questions for WB4APR which might be answerable by others.

First, I sent WB4APR a check for APRSData registration over three weeks ago and have yet to see it cleared. I sent an email to WB4APR@amsat.org but have not received any response. I'm assuming that you are either very busy or your amsat.org email might not be getting to you. Either way, its not a big concern. I just want to make sure it gets there. Concerning registration, will that particular registration number work if I download future versions of APRSDOS, Data, and TK?

Second, for WB4APR's and everyone else's information, my APRSData server (AD5ER) is on for the Amarillo area. I haven't fine-tuned the .POS files yet (I especially want to configure the voice repeater file, but it will take some time and research), but I am sending out APRS and FM voice satellite schedules. Its running just fine on a very old PC hooked up to a D700, which is temporarily in my house (and not in my truck where it belongs) until I get a TNC to use with my Icom 207. I don't get very many queries, but maybe its presence will motivate others to get involved with APRS and satellites.

Third, I also use APRSTK, and like it very much, but it will not go into DOZ mode. When I hit F10, it displays the following error:
"Illegal function call in line 0 of module ASTKW at address 052D:4E32   Hit any key to return to system", and after hitting a key it dies.
Am I the only one that has experienced this?

Fourth, I've been able to send and receive to ISS and PCSat (although PCSat seems to be weak lately), but I have yet to hit UO-22. I can receive the occaisional bulletin and a few APRS positions from it, but using the path of UOSAT5 I can't get any response. I have my APRSTK hooked up to a TH-D7 and a roof-mounted Arrow dual-band J-Pole. Will I require more gain and/or power to reach UO-22 or am I not configured correctly? Also, what's the deal with NO-45?

Finally, although its a bit off-topic, has anyone heard anything good or bad about Cushcraft's dual-band yagi antennas (A27010S or A2706S)? The bigger model looks like it would be able to out-perform Arrow's dual-band yagi satellite antenna, but looks can be deceiving, so I want to get a non-Cushcraft opinion. I'm considering either the Arrow or the Cushcraft as a satellite antenna mounted on WB4APR's simple antenna rotator system, and also occaisionally for terrestrial, long-range work (voice and packet).

Any input on the above questions would be greatly appreciated. Thanks for your time, and have a good 4th!

Brandon
AD5ER

Take a look at K0RX's MicroWeather
http://www.qth.com/RXcomm/

The "Texas-something-or-other" is Dallas Semiconductor, which no longer produces the 1-Wire system, but it's now available from a company in France I believe. But MicroWeather utilizes the Dallas sensors.

Hello Alan and group,

I want to put up a APRS weather station. I have lots of old weather stuff. An old Heathkit (Davis) 8 bit card with sensors and software. A Kantronics KTU. Tons of packet equipment.

I also am not happy with the quality of the outdoor sensors. From what I
have read lately, and that's not a whole lot, a company Texas something-or-other has a nice APRS compatible unit.

I would like to see what you come up with, please keep me in the loop. If
nothing else, this message is to show you there are others wishing to work
with you and put some time and money into the project.

APRS soon in the mobile. (KPC-3+, Alenco DR-1500, Garmen 50)

Thanks, Shanon KA8SPW

Subject: [aprssig] APRS WX stations

There may be no better use of APRS than for reporting weather observations.
Tracking capabilities of the network are of course the primary use of APRS
but because of the vagueries of the network sometimes trackers just don't
track. Weather on the other hand is stationary and the transmitter, antenna
and path can be optimized for the best efficiency.
Several kinds of users have need for weather data which can be described as
instantaneous or historical (30 minute old data is historical). Weather forecasters are the top of the weather food chain and every effort should be
made to report data which is useful to them. Fire weather, especially in the
conditions we face here in California and all over the drought-ridden southwest is another primary use of weather data and again, accurate data is
imperative. Outdoor recreation enthusiasts have an abiding need for good weather observations. Recreational pilots and skydivers are always interested in wind at several different altitudes. Nearly anyone that ventures past the couch and the front door needs good weather data.
I have a couple of weather stations in close proximity (10 miles apart) and
they almost never report the same data. One being at Mojave, often listed as
the windiest place in the US. Having several close-by weather stations helps
validate the data though, since sometimes our amateur weather stations are
prone to glitches in weather instrumentation, radio/tnc or computer. One of
the things I strive for in building APRS WX is bullet-proof reliability.
Since the only way to determine which is the best going out there in equipment available I am testing everybody's.
In order to put useful data on the network there are a couple of parameters
that should be observed as closely as possible. Putting your wind sensor

in
the clear is helpful. NWS specifications call for the sensor to be 10
meters
above the ground and 300 feet from any obstructions. In a home station
this
can be problematic but if you get it up as high as you can the lateral
obstructions will be minimized somewhat. I have a portable station (for
testing and remote observation) that has the wind sensor at 7 feet. It
is
amazing how much different it reads from my home station at 33 feet high
only 100 feet away!
Keeping your temp sensor and humidity sensor in a radiation shield (or
at
least out of direct sunlight) is helpful in recording accurate
temperatures
and dewpoints.
There is getting to be an abundance of good quality, relatively low cost
equipment out there that is being designed for APRS usage. Frankly I
haven't
discovered any of them to be of the Mil-Spec quality that I'm looking
for,
but by constructing much of my own equipment and using the best off the
shelf stuff I can find, I'm getting close. I'm getting ready to put some
solar-powered weather stations in the desert to support some wildlife
projects (Bighorn sheep water guzzlers) and this will be the test of
reliability of the equipment--weather and radio both.
While it is most useful to have your weather station reporting data
where
people are living, working and commuting, high level WX digis are useful
to
the forecasters (and weather nuts too). There are some pretty impressive
winds when you get above 5000 feet and we should know about it.
APRS has allowed me to merge my two favorite hobbies into one
interesting,
innovative and useful project. Everybody should have a weather station
on
their APRS digi.

well let me see, N1BQ-3 is most definitely a high-wide digi at nearly 1600
feet amsl and 10-1100' HAAT. Its near the top of a small mountain adjacent
to a lot bigger mountain and you better believe the weather people are
interested in the weather conditons here as are the 14 other people who live
on this road within 1 mile of the digi and who ping Findu for weather here
when they are away from home.

1) It'll fill up D700 message memories causing people to gripe

2) Assuming the "high-profile" digi is on a mountaintop: Is anyone (except skiers maybe) interested in the WX at the top of the mountain instead of the areas below?

Let me throw in another one:

My 15yr old son Phillip, KD5EDI, will be running KD5EDI-7 as 22 of our scouts head from Austin to Cimmaron, NM for a trek at Philmont Scout Ranch. They'll leave out on Tuesday 7/9. Too bad I can't get him to carry a GPS/VHF HT and TTII on the trail... Ounces turn to Pounds, and Pounds turn to PAIN! I don't blame him.

Where can one view these station siting guidelines and reporting
protocols?

By reporting protocols, are you talking about the data format, speed etc.
the Peet, Davis, RS or Ohio units output?

What is FMH-1?  WMO?

Interesting thought.

I can contribute a couple of small things to this.

First of all, my PCR-1000 scanner reaction tunes nicly and using the computer software could switch to any freq get a S report off the fox or rabbit, and then the software can feed that information directly into the AX.25 port. In fact any computer that has both an APRS station and a computer controlled scanner should be able to contribute automaticly to the DF request. OR how about this, Assuming I'm still interested in APRN, APRS transmits a message stating that it is ready to TX a SSTV picture on xxx.xx freq. The scanner switches over to that freq and processes the picture via it's own software, and then uses the AX.25 port to send a message back to station saying "Picture Received by APRN station KC8OBZ". Then the scanner is free for other uses.

Secondly, what about using the laptop (or PALM) running APRS program to decode the native output of the D700 while the D700 is running in APRS mode. That way you can decode the incoming packets and display on your map, trigger the D700 to send the smartbeaconing packets, and this would still allow you to control the B Band of the radio via your APRS program, all while allowing the D700 to do the gruntwork of transmitting routine traffic. I would love to ask Mike Musick for this feature, I could eliminate both the D700 head and replace it with a full color map at the same time. But I don't know what kind of responce I would get. Hint, Hint.

Wide, Relay, Trace. As opposed to Wide only.

WRT = Wide-Relay-Trace this what the digi is capable of doing along with the
widen / tracen protocol stuff..

Let's get some definitions and terms being used, spelled out:

FMH-1 Federal Meteorological Handbook No. 1: Surface Weather Observations
and Reports
December 1995 http://205.156.54.206/oso/oso1/oso12/fmh1.htm

http://www.ofcm.gov/fmh-1/fmh1.htm (Adobe Acrobat)

World Meteorological Organization (WMO), Geneva, Switzerland

WMO-WWW Tech Report 17
Guide to WMO Binary Code Forms (Part 1 deals with BUFR, Part 2 with GRIB).
May 1994
Available online at http://www.wmo.ch/web/www/reports/Guide-binary.html

WMO 306 Manual on Codes
1995

And for a bonus, there is the Weather Observation Markup Format (XML)
http://zowie.metnet.navy.mil/~spawar/JMV-TNG/XML/OMF.html

Useful paper from NOAA:
http://www.wrh.noaa.gov/wrhq/96TAs/TA9631/ta96-31.html

Rendered body type: text/plain

Most NWS documents are publically available online. They are generally not easy to find. I know of no centralized site where all NWS pubs are catalogued. Generally, the office or branch in NWS responsible for each program will maintain their own pubs and post them within their web site. Even when you find the correct office, the link to the pubs may not be obvious. I suggest you become familiar with some NWS sites, and find one that has a search engine within the site, then try looking for the name or number of the document. Because they are internal to NWS, they usually don't return good results from "regular" search engines.

The siting standards are contained in "Federal Standards for Siting Meteorological Sensors at Airports", FCM-S4-1994. It is maintained by the Federal Coordinator for Meteorological Services and Supporting Research (OFCM, NWS), Silver Spring, MD. I'm sure some will dismiss these standards because they are too difficult for hobby installations to achieve, but they are what we should strive for, and knowing that we probably won't get it perfect, use the standards as an example to do the best we can. At least they give us a good reference to understand how our installations might perform compared to a "standard" installation.

The "Bible" for observing and reporting surface weather, including aviation reports (METARS) is the Federal Meteorological Handbook No. 1 (FMH-1), entitled "Surface Weather Observations and Reports", FCM-H1-1995. It is also produced by OFCM. It breaks down each weather element into a separate chapter and discusses how that element should be observed, how the sensor should be sited, and how the element is reported or coded. "Old timers" should pay close attention, since in the early 1990's the US adopted the WMO standard METAR (Aviation Routine Weather Report) format for surface weather reports. For about 40 years prior to adopting the METAR format, the US used the SAO (Surface Aviation Observation) code format, which differs substantially. METAR is now a worldwide standard.

The World Meteorological Organization (WMO) is a worldwide organization that publishes standards for weather observation and reporting. The US is a member and adopts WMO standards, usually in their entirety, but sometimes only partially. Just like the FCC adopts ITU standards and publishes them as 47 CFR Part 97.

By "reporting protocols" I mean the standards published and adopted in the above documents and other WMO standards. There are also "algorithms" that are published by WMO and NWS which define how weather sensors manipulate the raw data they collect to produce values such as average wind speed, gusts, rainfall, etc. For example, a human taking a wind observation would observe the wind for a period of 2 minutes to determine the average direction and speed. An automated station, however, samples the wind at regular intervals, sometimes as often as every second. To produce a meaningful value it must store all the raw measurements during that 2 minute period and produce a result based upon a published algorithm.

The problem with most home stations is that they almost never follow the specification exactly. For instance, most are still using a 1 minute sampling interval for winds, which was a standard used nearly 10 years ago when the US followed the SAO reporting format.

Here's a few links to help get you started:
http://205.156.54.206/asos/index.html
http://205.156.54.206/asos/obs.htm
http://www.ndbc.noaa.gov/measdes.shtml (be careful here as some of these protocols are specific to oceanographic weather buoys)

Also go find the Weather Graphics Technologies web site by Tim Vasquez and download his brief but excellent primer: International Weather Watchers Observer Handbook. I could e-mail it to anyone interested, it's about 750K in PDF format.

If you have trouble locating FMH-1 let me know. I don't seem to have that link stored anywhere within reach.

Where can one view these station siting guidelines and reporting protocols?

By reporting protocols, are you talking about the data format, speed etc.
the Peet, Davis, RS or Ohio units output?

What is FMH-1? WMO?

Doug/KC7IMR

   Subject:  [aprssig] Re: What is sensitivity ?

   (Embedded image moved to file: pic30070.pcx)
   I forgot to address the second part... Sensitivity is only half the
   equation, if your receiver and the transmitter are the ONLY ones on
   the air
   on any freq adjacent, then yes it is most important, however
   sensitivity is
   balanced with selectivity which is the ability to ignore off freq
   signals
   which you do not need to hear..
            As you amplify the front end of the receiver which improves
   sensitivity, selectivity degrades as all components have overload
   figures
   which can eventually, with too much interference or overload, negate
   the
   gains of any additional amplifiers ( which is what improves
   sensitivity )
            In general all the components in a receiver which make it
   selective, reduce the sensitivity of the receiver at the same time,
   so
   amplifiers are added in the chain to recover losses induced by these
   components. Amplifiers can only recover losses in components after
   them, so
   any filtering components in front of them are losses.. period...But
   the
   closer the amplifiers are to the antenna jack, the more likely
   selectivity
   issues will get worse as overload and noise in general will rise
   along with
   the good signal..

            So all receivers are a tradeoff of these things, so as to be
   able
   to live in the RF environment of our imperfect situation...

Received a couple SVeeSix-CM3 from BG earlier in the week.   One antenna had some dialectric material over the antenna, the other did not. Is this just padding or does it serve other purposes?

Does the TT 2 require the TTL to RS-232 conversion or will it work on direct TTL levels?

PCsat is in Eclipses and Sapphire digipeater appears to be inop so I have updated the PCsat web page and the "User Service Agreement" to basically say the following:

We cannot keep PCsat parameters loaded as it resets on every nightime pass (14 times a day). SO we updated the recommendations to simply say that it wont work in the dark, and it will only digipeat on the sunny side after it has had some chance to charge up. This usually means afternoons.

The only PCsat digipeater callsign that will work is via W3ADO-1.

So use it to conduct any experiments you like before it is completely dead. Just dont transmit too often and share it. TYpically, we still recommend no packets any more often than once a minute or so unless involved in a 2-way QSO...

If you have any need to try the SIDE B transponder that downlinks on 144.39, contact me direct.

> I have a few questions for WB4APR which might be answerable by others.
>
> Will that particular registration number work if I download future versions of APRSDOS, Data, and TK?

Yes, all future and past...

> Second, for WB4APR's and everyone else's information, my APRSData server (AD5ER) is on for the Amarillo area.

Great work! Only ssend out satellites that are workable by mobile, so you dont wear out your welcome. Anyone that has an ALL mode rig and wants to operate the saatellites will also have his own tracking program and doesnt need the LIVE objects on APRS...

I'd recommend only NO44 (Pcsat), ISS, UO22, UO14, and SO41. Too bad AO-27 is dead now...

>
> Third, I also use APRSTK, and like it very much, but it will not go into DOZ mode. When I hit F10, it displays the following error: "Illegal function call in line 0 of module ASTKW at address 052D:4E32 Hit any key to return to system", and after hitting a key it dies.
> Am I the only one that has experienced this?

I noticed this too.. Dont hit F10. I'll have to fix that.
On my other APRSdos programs, is F10 still needed to run in the background under WIndows? I put that in many years ago when Windows was new and not sure if it still helps or not...?

> Fourth, I've been able to send and receive to ISS and PCSat (although PCSat

> power to reach UO-22 or am I not configured correctly?

You will never hear yourself on UO-22 becuase it is full duplex. By the time your HT TNC has changed from TX to RX, the Satellite has already begun the digipeat of your packet and coming into it late, yuou will never decode it.

Also, what's the > deal with NO-45?

It appears to be locked up. It is sending its two DITS once every minute or so, but it wont respond to commands or digipeats...

BEACONet lets you look at the world in ways never before imagined.
http://go.to/BEACONet

RIGblaster - LapTops with USB but no Serial Port

So you got a brand new LapTop computer and when you went to connect it to your RIGblaster you discovered there was no Serial Port. Since then you have been forced to run in VOX mode and then only if your radio has VOX. Well now we have a solution for this problem. West Mountain Radio now offers a USB to Serial Port Adapter by IOGEAR, Model GUC232A, which will allow you to connect the RIGblaster to that new LapTop. It is available on our website (http://www.westmountainradio.com) for $34.95.

Look under RIGblaster Accessories on the Pricing & Ordering page of
our Web
Site.

F10 does still work on APRSDATA, and I put it into DOZ mode while I run
APRSTK using the second serial port. Whether APRSDATA is running or not,
TK will still not go into DOZ. I haven't used APRSDOS more than a couple
of times, so I can't recall if F10 works on it.
Concerning UO22, during the last few passes I may have not had the TH-D7 in
full duplex mode, but if it is in full duplex mode should it work? I will
certainly try that the next time it passes over.
Thanks for the info!

You need at least cardbus to get USB.
Otherwise, you can get Par or ser ports in PCMCIA, though they are pricey.

Rendered body type: text/plain

Hello everyone, as of July 13th, aprsdDTN will be removed from service
permanently. The company I get my ISDN connectivity from is getting out of
the dialup and ISDN business. The company is not folding, just shutting down
the ISP side of life. It has gotten cost prohibitive for them to maintain
ISP operations at $20 and deal with people everyday that forget their
passwords, get viruses due to poor practice and trouble shoot poor phone line
quality. Increasing the fees is not pracitcal either since $9 usage based
dialup is becoming more popular too. I will not be without net, just 24/7
connectivity. My email and web site will not be affected. Broad band is not
an option in my location due to avalability and costs. I could make a very
snide comment about the FCC and broad band deployment rates at this point but
will not do so. I was fortunate that I had 24/7 connectivity for the price I
paid, but all good things must end.

The RADIO is full duplex, but the TNC is not. The TNC would need to be able to RX data at the same time it is tranmitting data. The single chip internal TNC in the Kenwoods cannot do that... That is why you can never see your own packets digipeated by UO-22, it is full duplex and digipeats your 9600 baud packet instantly with NO TXD....

And you cannot see it on FINDU, bucause I dont think we have ANY one running a permamnet satgate there... But it would be nice...

If we define the auto-QSY protocol proeprly, ANY rig with a serial control interface can then be used with a PIC processor to do all kinds of things.

1) QSY on command when someone wants to talk to you on IRLP/ILINK
2) QSY when a satellite is in view
3) QSY to do a sig check for the DF application we are discussing
4) Add local Channels to a memory bank when a mobile enteres a new area.
5) QSY to the talk-in channel for any special event, etc...
6) QSY as commanded by net control for any applications...

de WB4APR, Bob

On Thu, 4 Jul 2002, Dick Reichenbach wrote about the auto-QSY for DFing:

186. [aprssig] TinyTrakII (TT2) and Trimble SV6 interfacing

From: "G. Beat \(W9GB\)" <gregory.beat@attbi.com>
Date: Fri, 5 Jul 2002 10:02:17 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88169-2002.07.05-10.42.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Laird -

You are going to need to build an RS-232 interface for the SV-6 for the following reasons:

1. Interface the SV-6 to a computer with Trimble software for initial self-testing of SV-6.
2. Assure that the SV-6 has an initial almanac loaded (your current location).
3. Load the NEMA configuration into the SV-6. Most of the BG Micro versions were used in embedded applications that used the Trimble protocol (This is in the BG Micro instructions, downloadable from their web site).
4. Set remaining configuration parameters for SV-6.

Then you have a working SV-6 outputting NEMA sentences.

Your real question is: Can the PIC microcontroller (TT2) handle the SV-6 TTL output, without the extra MAX232 chip?

The serial in/out ports (J1 connector on the TT2) are applied to pins 2 and 3 (with a 10K resistor in series) of the PIC 16CE625-20/P microcontroller.

This is covered on page 4 of the TinyTrakII.pdf (available on the Byonics web site)

In reference to J1 (The DB-9 serial port connection) Pin 2 is used to transfer serial data from the TinyTrakII to the computer. Pin 3 is used to transfer serial data from the computer or GPS to the TinyTrakII. Pin 5 is serial ground.

The PIC controller also has to be programmed (with your call sign) from a computer serial port (RS232). It might be possible, but looks like you would then have to have a TTL to RS-232 interface for the TinyTrak 2 to your computer.

Rendered body type: text/plain

At the end of the Byonics documentation (N6BG) they have this added caveat:

Tiny Trak II uses inverted TTL levels (0 & 5 volts) for serial
communication rather than true RS-232 signal levels (-12 & +12 volts).
This may cause communication problems with some GPS receivers and computers
(especially laptops). A RS-232 level converter, such as the MAX 232, may be
used, but the TTL levels will need to be un-inverted, with transistors or a
TTL inverter chip (such as the hex inverter 74AC04)

Bob,

Please remember back to last August when I reported to the sig that I worked the UO-22 digipeater with my TH-D7AG and my laptop,
using the internal D7 TNC. The important thing to remember is to have the D7 in duplex mode.

Please find a copy of my posting from last August below.

73,
de Ken,
N5EQT

Hello all.

Due to popular demand on the AMSAT SIG, I thought I would post my TH-D7A(G) to UO-22 digipeater settings here on the APRSSAT SIG for other interested parties to see.

I am using a laptop in terminal mode (like Procomm Plus or Hyper Terminal) & the TNC functionality of the TNC. In other words, I am not using the APRS TNC function. Press the D7 TNC keyboard button twice for this function.

My TNC configuration string is pretty simple.

```
MYCALL: N5EQT-3
HBAUD: 9600
UNPROTO: APRSAT via UOSAT5
```

Press the DUP key on the D7 keypad to place it in full duplex mode.

All other TNC settings are the factory defaults that the D7 powers up with.

You will need to go to (Menu) 1-4-1 & set the packet band for A:TX B: RX, since mode JD is up on 2M & down on 70cm.

You will also need to go to (F) 8 & set the step size of each VFO to 5 Khz.

To compensate for Doppler shift, I use a beginning (AOS) downlink frequency of 435.130, a center of pass frequency of 435.120 & I ended the pass (LOS) with a frequency of 435.110. I tune the D7 in 5 Khz steps.

The downlink is pretty easy to find because it is constantly transmitting. I usually hear periods (seconds) of silence, & I think it is because of nulls in my receive antenna pattern. For those new to 9600 baud FSK, it sounds like open squelch noise. After listening to / for the signal, you will find that it has a certain 'quality' that distinguishes it from regular squelch noise.

As a verification of your receive capabilities, see if you can receive the various news & status bulletins. A sample follows below.

```
UOSAT5>NEWS:Use both uplinks - 145.900 and 145.975
UOSAT5>SKED:Sked 1.5 File2:75b72 Next:Wed Aug 15 12:00:00 2001
UOSAT5-12>BBSTAT:Open 12a :
UOSAT5-11>STATUS:B: 75591616
```

UO-22 uses 2 uplink frequencies, 145.900 or 145.975 (your choice, both are active). Since there is approximately +/- 3 Khz of Doppler shift during an entire pass, I have found there is no need for uplink tuning.

For my pass predictions, I use STSPLUS. I am familiar with it & it works very well. It is a freeware / shareware program & can be found at:
http://www.dransom.com/stsplus.html

My antenna is a Cushcraft A270-6S (3 ele VHF & 3 ele UHF) antenna. A duplexer is not required for this antenna. Pointing, via the armstrong method, in the general direction of UO-22 works here.

My uplink packet looks like this:

```
EM22lu/- de N5EQT Pls QSL via kenp@etex.net
```

When I am successfully digipeated via UO-22, my received packet looks

```
something like this:

N5EQT-3>APRSAT,UOSAT5*:EM22lu/- de N5EQT Pls QSL via kenp@etex.net

That's it. The usual disclaimer of Your Mileage May Vary applies.

See you on the birds.

73,
N5EQT

You just have to invert the signal.  A transistor and a couple of
resistors work just fine.  It'll save you from having to put in a
chip.

I'd highly recommend adding a lithium coin cell to the backup voltage
pin on the Trimble as well.  Without this (or continuous 3V from some
other source) you'll need to wait about 15 minutes with clear sky for
the GPS to re-gain the almanac and get a lock.  With the battery it
locks up reasonably fast.

190. [aprssig] PCsat 9600 baud experiments!

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 5 Jul 2002 13:26:10 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88183-2002.07.05-13.04.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

CALL FOR EXPERIMENTS:

I just realized that since PCsat is resetting itself and thus the 9600 baud UHF receivers are coming on by default (even though we would like to keep them OFF to save power), we may as well conduct experiments to see how well they are working to validate future designs.

THey were designed with a 40 KHz wide channel so that uplinks would NOT have to make any doppler adjustments. THe wider bandwidth and added UHF path loss requires 13 dB higher power for the same link performace as the 2 meter 1200 baud uplink, but it should work well with a 50W mobile D-700 kenwood set to 9600 baud. Please test this for us...

Thanks.

Yes, but in general, you will never see your own packets digipteated. In rare instances if the downlink is full of BBS traffic and your digiepated packet does get slightly delayed before being inserted into the stream, there is a chance that the delay will be sufficient to see it yourslef. But in general and with the light usage of UO-22, this will be rare indeed...

But it does work! Others will see you. I saw 3 people doing APRS via UO-22 on FD...

Anybody have any suggestions, recommendations - good or bad, regarding wx stations for a home wx APRS station? Our new club digi, STLWTR, should be on the air soon, so I thought I'd put a wx station on the air. I have a Radio Shack WX-200 currently and was planning to get the Oregon Scientific WM-918 as it is the same unit with longer cables. However, it doesn't look like the WM-918 cables will be long enough to get the wind unit up to the NWS-required 10 meters and still reach inside to my shack. I'm also leery of the wireless units due to the RF fields around my house. I'd be using the station with the latest flavor of APRS+SA, if that matters.

I'm not sure I understand.

You can't get USB in anything less than cardbus. (NOT pcmcia)
You can get ser and par ports in PCMCIA, PC-Card, and Cardbus.

I extended the anemometer cable on my WM-918 with no problem. In fact, I
still have the entire 100' roll of cable I bought in the circuit - never
got around to cutting it off. I checked the wind direction readout with and
without the extension and there was no detectable difference.

Bob,
We were talking about this earlier, but I don't remember the answer.

If we go up on 435.250 at 9600, is it possible to come down on 2
meters at 1200? If memory serves me correct, it would be an addition
to the protopath. I think you said that the gate was not programmed
all the time, but I don't remember.

Thanks,
Eric KF4OTN

YES, but only if we command UIGATE on. It is OFF by default, so that is
why I did not receommend it, since your chance of hitting it after we
command it are small. If UIGATE is ON, then the path would be via
XBAUD...

Ill try to turn it on when I can, but it only holds till dark. Probably
not worth the trouble. NEvermind, I wont turn it on, because that will
just add another possible unknown. SO the only 9600 baud that will work
is up on 435.250 at 9600 via W3ADO-2 and down at 9600 on 145.825.

202. [aprssig] TinyTrak II - Garmin GPSII+ Wiring

From: Robin Midgett <rmidgett@bellsouth.net>
Date: Fri, 05 Jul 2002 17:34:46 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88217-2002.07.05-18.12.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,
I found a convenient way to supply external power to a Garmin GPSII+ when using it in conjunction with a TinyTrakII; wire +12 VDC from the TTII to pin 9 of the TTII DB-9 connector, (which isn't used by the TTII) & build a four conductor cable (I used Belden 8723) with a mating DB-9 connector to interface with the GPSII+. Supplying power to the TTII for programming doesn't present a problem for the computer serial port since (according to info I could find) pin 9 on a DB-9 serial port is Ring Signal, a 12V input anyway.
I was cautious enough the first time I connected the TTII to the serial port to choose a serial port on an ISA card, just to avoid potentially damaging an on-mother board serial port. Works good, lasts long time!
BTW, an Altoids tin makes a dandy TinyTrakII enclosure; just big enough for easy installation of a DB-9 on each end + a power lead tail.

Thanks & 73,
Robin Midgett KB4IDC

Well, there are a few... But not many, and what there is you cannot rely on to be 'generic'.

About the only thing I've seen 'generic' is a USB port to this little slotted
ball that sits on your desk. It was designed to take the CF and other small cards, but the one version actually had PCMCIA on it as well. It was advertised as only supporting ATA cards though, and only in IO mode. Although I suppose if it supported ATA in IO, if it read the tuples at all, it should be able to do anything. But they MAY have just 'hard configured' it to do ATA in the mode where you pull a pin and it's now compatible with IDE. (Hmm, I have a few of those adapters laying around as well.)

Mike

Rendered body type: text/plain

I have a Davis Weather Monitor II and have been unable to get the correct value for Barometric Pressure to show up. What is the "secret" to getting Barometric Pressure working with WinAPRS?

There are fields for Pressure, Pressure (mb), & Press Offset (mb). I've tried different things but can't seem to find the correct set-up

Thanks in Advance!

Mark, N9WST

Don't bother spending money on a new station; the one you have will work fine, with a little care. First, I believe you can extend the cables to 100 ft or more without any problems and little or no affect on calibration. Here's one of the best sources for info/support on these units:

http://www.weathermatrix.net/bbs/wx-200board/

Here's a great discussion of the temp sensor intermittent problem, and several solutions:

http://www.qsl.net/zl1vfo/wx200/mods.htm#Problems

BTW - I think the OSI cables are only five feet longer anyway! Still far too short for a proper installation. This has been discussed exhaustively on the support board. There should be tons of info there.

Subject: [aprssig] APRS WX station

Anybody have any suggestions, recommendations - good or bad, regarding
wx
stations for a home wx APRS station? Our new club digi, STLWTR, should
be
on the air soon, so I thought I'd put a wx station on the air. I have a
Radio Shack WX-200 currently and was planning to get the Oregon
Scientific
WM-918 as it is the same unit with longer cables. However, it doesn't
look
like the WM-918 cables will be long enough to get the wind unit up to
the
NWS-required 10 meters and still reach inside to my shack. I'm also
leery
of the wireless units due to the RF fields around my house. I'd be
using
the station with the latest flavor of APRS+SA, if that matters.

Who says "Both findu.com and NOAA want the
wind value in this case to be in MPH"?  Does the Citizen's Weather
Program directly conflict with FMH-1, which in Chapter 5.5.1 clearly
states that all wind observations will be reported in KNOTS.

To: APRS Spec Discussion List
Subject: [aprsspec] Feedback on the APRS101.PDF documentation

I just finished adding an internet APRS weather report feature to Davis
Instruments' WeatherLink program.
This feature generates APRS packets from a weather station (and user
entered
Lat/Lon info) and sends them
via the internet to an APRS server. This feature was added at the
request of
and to support NOAA's Citizen
Weather Observer's Program.

I had a couple of comments about the APRS101.PDF documentation file you
may
want to consider for the next
time you release a new version.

1. In section 12, page 64. You describe the Positionless Weather Data
format
and state that wind speed values are
in MPH. On page 65, for "Complete Weather Reports with Timestamp and
Position" you state that "... the 7-byte Wind
Direction and Wind Speed Data Extension replace the "cccc" and "ssss"
fields
...". Back on page 27 the definition of the
"Wind Direction and Wind Speed" data extension says that wind speed
should
be expressed in knots. This will result in
inconsistent units (i.e. the current wind given in knots with the wind
gust
given in mph). Both findu.com and NOAA want the
wind value in this case to be in MPH.

2. Again on page 64, It is really hard to tell which rain field is
supposed
to use the lowercase "p" and which is supposed to
use the uppercase "P". It is possible to choose a different font so that
it
is more clear?

3. This software works on Davis' new line of weather stations, the
Vantage
Pro. I am using "DsVP" as the Weather Unit Type
and am submitting it as a candidate for the official list.

4. What should I do about the APRS Software Type field? I know that
there is
at least one other software package in the same niche
as mine (i.e. generating APRS weather packets for internet distribution,
but
only as a small part of a general weather display
and data management program). I am using a "." (period) for now.

Thank you for your consideration
Edward Blair.

Rendered body type: text/plain

I just received my Trimble SVeeSix-CM3 GPS from BGMicro and am attempting to locate the software for it. From searching the Trimble web site it appears the product has been discontinued. Unlike other companies Trimble appears to remove software for the discontinued products from their web site.

Therefore could someone please send me the following files:

Tk502z.exe
Tk510.exe
502_NMEA.exe
502_TAIP.exe
GPSSK.exe

Thanks,

Chuck Gooden - N9QBT
Rockford, Illinois

Chuck & other SV-6 buyers-

BG Micro supplied a 5 page Adobe Acrobat file for the Trimble SV-6 CM3
http://www.bgmicro.com/pdf/acs1394.pdf

This file supplied by BG Micro (with photographs and marked components) is of the Heathkit or Elecraft quality of instructions.

I would suggest both printing and saving this PDF file to disk. This can be
accomplished
with the latest version of Adobe Acrobat available at:
http://www.adobe.com/products/acrobat/readstep2.html

Here is the Trimble ftp site with all of the required files (I just checked it and it works).
ftp://ftp.trimble.com/pub/sct/embedded/bin/

209. [aprssig] UIDIGI for dummies

From: KC7ZRU - Tate <kc7zru@arrl.net>
Date: Fri, 05 Jul 2002 20:13:09 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88241-2002.07.05-21.51.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK,

I've got the UIDIGI package, a prom burner (Prompro-8x) but without
software. I'm in contact with Logical Devices, Inc to remedy that. My
problem is in deciphering these EPROM part numbers. I read that the
MFJ-1270 family needs a 27x256 (or 27x512 and do the pin 1 toggle)
EPROM. However, when I search mouser.com I find nothing that matches
either.

Am I not looking for the right thing? Anyone got any blank TNC2
compatible EPROMs they want rid of?

Thanks in advance!

Rendered body type: text/plain

```
Current version is 2.14 found in APRSPLUS214.zip
2002.07.05 V2.14
Fixed - Object description text was doubled.
Fixed - Untracked stations posit reports was not properly sorted and deleted.
Fixed - NWS data stream would produce an error.  This was fixed in Patch to v2.12
New - Settings, Config section, DeletePosFileOnStartup. Default=0.  This clears the stored last known
position for all stations on startup.
PHG - Range Circles for PHG have been reduced by 1/2 to try to better reflect range to Mobiles.

Thanks to Chuck, Mark and John for the part # info - just what I need,
except for one detail...

Is there a minimum speed I should be looking for or can one "get away"
with using the, albeit slightly, cheaper 150ns EPROM? Looking to use in
TNC2 clones (MFJ-1270B/C, etc)

215. [aprssig] Fw: 9600 Baud on 145.825

From: "Eric Christensen, KF4OTN" <kf4otn@cox.net>
Date: Sat, 6 Jul 2002 17:46:51 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88334-2002.07.06-17.25.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If anyone has the ability to receive 9600 baud on 145.825, please monitor on this next pass and during the afternoon tomorrow. KF4OTN-12 will be operating on the 70cm side of PCSAT for the next day. If anyone else can setup their systems to transmit on 435.250 at 9600 baud, lets see what happens over the next couple of days and check the system!

73s,
Eric KF4OTN

216. [aprssig] Re: Fw: 9600 Baud on 145.825

From: "Brandon Cole" <brandonacole@yahoo.com>
Date: Sat, 6 Jul 2002 17:26:4
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88336-2002.07.06-18.04.03--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just finished transmitting (435.25) and receiving (145.825) 9600 baud
tests during the PCSat pass from about 2140z to 2155z (06 JUL 02.) My
location is Canyon, TX (DM94), and I was using a path of W3ADO-2, as WB4APR
indicated. I had two stations set up, a TH-D7 and laptop, and a TM-D700
and pc, both running APRSTK. I was using the program mainly as just an
output viewer, but also as a satellite location reference. I tuned both
radios manually for doppler. Transmitting at full UHF power with the D700,
I never did see my own digipeated packet, or any other packet, on either
system. I did, however, hear a 9600 baud "swish", as was described
earlier, after three of my at least a dozen transmit attempts, each at
approximately 2043z, 2050z, and 2052z. PCSat was at low elevations at each
of those times, so if I did reach the digi it was no doubt due to the omni
antennas I was using (its all I have right now.) I know I was receiving
good because I heard plenty of 1200 baud activity during most of the pass.
I will try again tomorrow and listen for KF4OTN and anyone else tomorrow.

On a slightly different subject, what, besides the obvious good receive
antenna, software(APRSTK?), and full-time internet connection, would be
required to get a satellite gateway running for UO-22, or for another
satellite that might need one? I would be willing to try it out, although
it might take some time to get all of that set up.

I've got a dilemma then. The default name for this list, as distributed with
the APRSplus program, is "APRServe.txt" complete with the mixed-case
naming. The name is hardwired into the program; I guess Brent was reluctant
to get away from the classic DOS/Win3x 8.3 naming convention.   Since I
orignally started collecting all known servers to add to the list for this
particular program, I just retained the name.

I suppose I could label the link "APRS Internet Server List" but retain
APRServe.txt as the actual filename.

> 73
> Don WB5EKU

Well, this is very good data! Thanks! This appears to suggest:

1) the receiver is still centered on 435.250 as designed
2) The wideband mod to the receiver seems to tolerate as much as +/- 5 KHz easily, but not a full 10 KHz turning error. Thus the receiver might work routinely with - 5KHz setting at first half of pass and then a one-step switch to + 5KHz at middle to end. THus a TWO step tuning instead of the exact 5 step processes needed for a narrowband receiver.

Things to try next:

Maybe the loss of DECODE at low elevations was due to doppler on the 2m downlink. So since PCsat is centered at 145.827 or .828, then set the downlink to 145.830 at start of pass and switch to 145.825 towards end.

If my above assessment is correct, then at AOS, the receiver bandedge might be 435.235 up to 435.245 and at LOS be 435.255 to 435.265

But your data appears to support our design objective that a FIXED station at 435.250 should work for the center half of a pass without having to make any adjustments for Doppler. and since we designed for Mobiles, who cannot really see much of the sky at AOS and LOS, this seems about right.

I really appreciate your taking this data in the true experimental spirit
of HAM radio. I cannot do it easily, becasue I have to be commanding
PCsat during my passes and since I use a full-blown OSCAR array, it does
not give me realistic data on what the design user experiences.

PCsat by default will have its UHF RX on, so everyone is welcome to
continue experimenting.

```
Uplink    435.250 -/+ 10 KHz Doppler
Downlink  145.828 +/-  3 KHz Doppler
VIA W3ADO-2
```

First of all, it is considered extremely rude to take a private email,
change the title, and send it to a public email list. There really was
not a need to make this public, I simply expected that you would fix
the incorrect language for the next release, rather than try to start a
public discussion, but since you chose to, I guess I should reply
publicly as well.

The problem is that there is a lot of confusion about what APRSserve is
and what the APRS IS is, I've spent a lot of time trying to make it
clear. The files can be called whatever the program expects, but when
discussing the system, and most certainly in files intended to be used
as references, I think it is important to use the correct and
unambiguous terminology.

Rendered body type: text/plain

```
Greetings listers!

I am trying out a Garmin GPS-35 with a Kenwood D7A.

Everything works BUT,

The little two-tone beep the kenwood makes when it detects a "lock" from the
GPS? It keeps beeping every 15 or 20 seconds.

The "decimals" flash as if it has a lock all the time (they never go
"solid").

It is almost as if the GPS-35 transmits some "lock" data periodically and
the kenwood interprets it as a "new lock".

Having the kenwood beep so often will get annoying really fast!

Anyone experienced this before?

Thanks!

Robert

If I recall correctly, the constant flashing indicates a good lock.
Worry when it stops. As for the beeps, I imagine that you have the
setting that tells the unit to beep for every packet received turned on.
You can set that to beep for all, only for new stations, just for yours,
or none.

No, that is not it.

It is definately the "good lock" beep (two tones low-high, it is not the
"mine beep" two tones high-low). I have it set for "mine", which, AFAIK,
does not affect the behavior of the "bad lock" and "good lock" beeps

I WANT the this beep to stop, otherwise, at every 15 to 20 seconds, it will
drive me crazy.

The GPS III+ DOES NOT cause this.

Try connecting the GPS-35 to a computer and disable all of the Garmin proprietary strings. I did that with mine which is connected to a D700 and it works great.

Hope that helps.

229. [aprssig] Overlapping digipeater

From: Adi Linden <adil@adis.on.ca>
Date: Sun, 7 Jul 2002 10:10:45 -0500 (CDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88421-2002.07.07-10.48.44--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hi,

I have a digipeater and igate where I have internet access but limited
range. Now I wish to place another digipeater on a tower on a hilltop.
Unfortunately that hilltop location doesn't have network access. Therefore
I will have to keep the igate where it is, even though its coverage area
is included within the hilltop digipeater.

What's the best way to set this up so everything the hilltop digipeater
hears is received and relayed by the igate? What do I do for stations that
are within reach of both digipeaters?

Thanks,
Adi
VA3ADI

230. [aprssig] Re: ICOM has digital voice idea

From: "Brandon Cole" <brandonacole@yahoo.com>
Date: Sun, 7 Jul 2002 10:32:51
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88424-2002.07.07-11.10.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

It looks like a great idea, but also a very expensive one. I would like to see new ideas that try to incorporate the existing voice repeater and/or digipeater infrastructure. I haven't been able to find much documentation about them, but the new Alinco radios that are digital-voice capable look promising, at least on paper. Perhaps APRS could be incorporated into a digital-voice data stream, which could then be used on the plethora of 2m/70cm voice repeaters, after modification (if that is possible). Its already possible to incorporate APRS over an existing repeater with MIC-E, but there doesn't seem to be too much of a desire to go in that direction, and that approach wouldn't lend well to growth. The digital approach would be better for many reasons. Perhaps in another 15-20 years there could be a 10GHz backbone network for voice and data. The thing about the D-STAR plan that bothers me is the idea of internet access. I hope they are thinking of ham applications (such as APRS gateways and the like), and not just web surfing. I think the FCC would have something to say about the latter.

Koy,
Try Weather Display, its fairly priced, the author gives tremendous support
and it works with every weather station hardware I know of.
http://www.weather-display.com/
I have been using it with APRS+SA and Dallas 1-Wire sensors for about 2
years now. I recommend it highly.

Rendered body type: text/plain

If you want the GPS to be contained inside of the box, then somthing like a
Motorola Oncore unit like the one TAPR sells is the way to go, just mount
an anttenna jack (such as BNC) on the outside of the box. If you arn't too
worried about that, I would go the Garmin eTrex route. The basic yellow
eTrex can be had for around $99 or so on www.amazon.com or several other
online GPS dealers. You can also check WalMart and other stores like that.
 I just recently built a TT2 for a friend and I told him to get the Yellow
eTrex and it works great.

Rendered body type: text/plain

Just for kicks, check out my TT's on my page at http://www.ke4nyv.com
(TinyTrak section). I have built two of my own and two for others. The to
I built for someone else are identical to the unit at the bottom of the
page. It's a RadioShack project box and with a bit of trimming on the PCB
or careful grinding with a Dremel, it fits perfect.

Rendered body type: text/plain

Ok, hope this goes better than my last question.
I have been trying to get the NWS Shapefiles to work with my winaprs 2.5.1.,
but when I recieve advisories I get an error message that states Global
labels failed to allocate, or something to that nature. In my winaprs
directory I have created a folder called NWSshape and downloaded and
unzipped the following files from the following page.
County Warning Areas Everyone should have this one. It is the outlines for
the County Warning Areas, there are only 121 of these.

AWIPS Counties These are the county outlines for 3232 counties including
Alaska, Hawawii, Peurto Rico, and Guam.

Zone Forecast Areas These are warning zones, which are similar in size to
counties but have different boundries.

Are these the right files? From this site:
http://isl715.nws.noaa.gov/mapdata/newcat/
Any indepth help on this would be appreciated..
Thanks

Setup the 'hilltop' as a RELAY WIDEn-n (etc.) digi

Setup your I-gate as a RELAY digi, or just as an I-gate with no digi.

237. [aprssig] Need Help with a packet station.

From: Anthony Ferguson <spider24112@yahoo.com>
Date: Sun, 7 Jul 2002 11:33:05 -0700 (PDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88446-2002.07.07-14.11.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello To All.

I have a problem, I hope that someone can help me with. I have been trying to get packet running on my pc using the sound card. Here is my set up and programs I am using. The computer is a HP 7840 and sound card is sound blaster PCI 128. I have downloaded both AGWPE Version 2002.10 and WinAprs Version 2.4.6.

I have something working correctly because once I start the AGW program and WinAPRS up and running and go through all the things needed to get APRS functional such as going to settings and ports list highlight AGW on local click open, I see that it is active and also the version is in the comments field . Then I set up my station information call sign lat/long info . I see my station of the map which I am using Midalantic map. I see my call sign and can see packet burst on the bottom of my screen. which means that I can receive and that is all.Also I have tried to open up the VHF PORT and I get a popup saying PORT FAILED TO OPEN.

I press the f2 key and here is what happens. I see that the AGW TNC icon displays a red pixel which indicates TX , The interface which is a RASCAL interface by K4ABT Buck Rogers , it's LED red lite comes on showing a TX signal. My radio ICOM 706MK2G doesn't transmit at all when the f2 key is depressed. ALL I CAN DO IS RECIEVE HELP!!!!!

How about this setup? http://dayton.aprs.net/magic.html

A basic synopsis of this link is that the hilltop digi would do it's
regular
work as a digi, and route all the packets onto a UHF network. The Igate
at
your house only hears the UHF network, and igates that information to
the
internet.

http://www.tapr.org/cgi-bin/wilma/aprssig

This could really cut down on bandwidth here on the sig. Maybe even add this
to the tagline from the mailer. I've been on the sig a few years, and we
often see the same question asked time and time again. I find my self very
often going back and quoting a previous sig post to answer questions here.

In comparison this is a gentle group compared to other groups I monitor.
There is often public flogging for asking the same question some one just
asked. I will have to play with this search engine a bit.

I'm truly sorry for bringing this up...I vaguely remember a thread about the
trials and tribulations of interfacing an eTrex to a TNC or something like
that. Could someone refresh my memory on this, please? Maybe I'm confusing
this with an Earthmate?

If memory serves me correctly that may be a PacComm Compatable TNC and would
use the
HandyPacket firmware which would allow it to be used stand alone with a TNC.
It has been a
few years since I have heard of the beast so I am a bit foggy. The
HandyPacket firmware was/is
a fine tracker, I have one myself.

Rich

I assume you are referring to the Paccomm ROM upgrade for the HK-21.

This ROM upgrade brings the HK-21 up to version 5 of Paccomm firmware, which is their most recent. It includes commands and features which support APRS operation in both tracker and digipeater configurations. While it does does not support WIDEn-N and TRACEn-N digipeater operation, it does support TRACE digipeating and callsign substitution.

Is it worth the $50 upgrade cost? It depends on what you plan on using it for. If you're just using it in a fixed station with an APRS application, it will probably be OK as is. However, if you plan on using it with a GPS receiver in a tracker configuration or as part of an APRS digipeater, than the upgrade is a must.

Rendered body type: text/plain

Hi All,

I have for sale a Garmin 45 8-channel GPS receiver, in excellent shape (physically and operational), with original box and manual. It does have an NMEA port for APRS operation, as well as 250 waypoint memories. It only receives 8 satellites, as it is an older unit. This was my first GPS receiver, and I've kept it around as a spare to my Garmin 12XL. Rather than letting it sit, though, I'm thinking someone might be able to put it to use. I will be happy to part with it for $30 as well as the cost of shipping to your doorstep. Please email me if interested.

73,

```

Probably so. The Earthmate only puts out Rockwell Binary or something like
that. The eTrex can be set for NMEA out.

You're much better off to buy the third party plug or cable. Garmin is very
proud of their data cable. I got a very nicely built cable for $15 or so.

The only other oddity I can think of is that the eTrex is rumored to be
VERY picky about the voltage supplied. (I've only used mine on battery to
date, since I have other non-display GPS units for APRS use.)

HTH
Bill

Hi All,

    I have for sale a great 2-meter transceiver that can be dedicated for
APRS use, or used as a spare 2-meter rig.  It is a Ramsey M146FX 2-meter
transciever, built from kit form, that puts out ~5 watts.  It has 12
diode-programmable channels (for simplex or repeater operation), and
includes the instruction/service manual.

    I am willing to part with it for $45 as well as the cost of shipping to
your doorstep.  Physically it is in excellent shape, though it does need a
quick bit of tuning, as the transmitter either outputs 5 watts or less than
1 watt intermittently.  I'm thinking it is just a cold solder joint, though
I have not had time to troubleshoot, nor am I anticipating time in the
future.  Rather than letting it sit, perhaps someone here might want to make
a quick fix and have a great APRS rig! Please email me if interested.

73,
Brian, N5ZGT
Albuquerque, NM

I've been using the etrex for two years now without any problem whatsoever.
I am using the Garmin lighter plug for power.  Actually, I got the
power/data combo cable and built an adapter to connect the nine-pin data
jack to a mini stereo for the D7-A.  Great little GPS for the price.

Now that ISS has returned to packet, we seemed to have lost some of our
permanent IGates that take the downlink and feed it to the internet and

thence to http://www.ariss.net.

On the last USA pass, I only saw packets being injected from the KE6AFE
IGate in California, nothing on the east coast. With the smaller
footprint of ISS, we need as many as 6 or more permanent IGates across the
USA.

Only partly on topic... Does anyone know how to use more than one sound card with AGWPE? I have read http://www.qsl.net/soundcardpacket/ and know how to run a radio off each audio channel (left and right) but can't figure out how to use more than one sound card at a time. (This is not the same as using one card for normal windows audio and the other for just packet. That is well documented.)

The reason I ask is that I have half a dozen scanners sitting idle that would make great IGates. Currently, I have one locked on 144.39 and one locked on 145.825 feeding UIView through AGWPE. If I could get AGWPE to see the second card in the system, I would have two more audio channels to play with. One could be used for ISS and the other for the 9600bps PCSat feed.
Is it as simple as running two instances of AGWPE from two different directories?

Matt (k4mls)

I guess Igates (and SATgates) should work just fine with a receive only
radio. Please correct me if I am wrong...

Are there any good sources for VHF receivers? Even some nice homebrew
receiver project? Still looking for a homebrew/project type VHF
transmitter with no more the 5 Watts output...

Adi

Some older and recent scanning radios are cheap on Ebay and at Flea
Markets. They work very well.

```
> From: Adi Linden <adil@adis.on.ca>
> I guess Igates (and SATgates) should work just
> fine with a receive only radio.

    They will. No need to tie up an expensive
transceiver if you main purpose is to gate. As I
noted earlier today, I have a scanner for 144.39,
one for 145.825 and I'd like to add two more for
ISS and PCSat/9600.

> Are there any good sources for VHF receivers?

    Scanners are all over the place and dirt cheap
to boot. When public service went trunked a few
years ago, just about everyone upgraded. It is hard
to find a scanner that doesn't cover two meters. I
find Radio Shack/Realistic/Bearcat scanners a flea
markets and garage sales for under $15. Some are
under $5.
    Most have worn out buttons (usually 'scan' and
'manual') or poor displays (PRO2004/5/6s especially)
but, for a SatGate, you're going to lock it on one
channel and rarely if ever look at the display.

> Even some nice homebrew receiver project?

    I don't think you could homebrew a receiver for
what you can pay for a scanner at a garage sale. I
picked up a Bearcat 300, PRO2004 and two Bearcat
895XLTs (!) for $45 a few weeks back. The 2004 has
a bad display and one of the 895's 'scan' buttons
sticks but the rest were in fine but used shape.

    Matt (k4mls)

The HK-21 Pocket packet TNC is a terrible match for use with the Palm computers.
Color is wrong. Cables are too long. I'll be happy to make a fair deal if anybody
would like to get rid of one of these lemons. No upgrade ROM needed. While the
upgrade turns it in to a standalone APRS tracker, the basic ROM does KISS just
fine.   I'm used to it and I'd hate to see anybody else have to suffer with this cute
little packet combination...

73,
Bill

I would also like to know the details of setting up a satellite/internet
gateway for ISS, PCSat, or UO-22. I only have an omni antenna right now,
but that's better than nothing. I'm located in Texas, which I would think
would be a good, central location for a gateway. I don't yet have cable
internet access, but that can be obtained quickly. Also, I would like to
learn more about the software requirements for all of this. Will I still
be able to use APRSTK? If so, will I only be able to gate one satellite,
or can I let APRSTK control my Kenwood and have it monitor all three?

I also have an HK-21 that I plan to use with a Palm and an Alinco DJ-C1T for
a tiny portable packet station. My only problems so far are time and
finding replacement AAAA NiCd cells for the TNC.

I've tried it all strung together through the hotsync cradle and it works
great. I'm not planning to use it as a stand alone tracker so I'm just
running the standard firmware.

A thought that came to mind (while grilling my food this evening), what
about APRS messaging? Will that work via satellite and is there much use
of it? I would think this would require transmit as well.

>   I don't think you could homebrew a receiver for
> what you can pay for a scanner at a garage sale. I
> picked up a Bearcat 300, PRO2004 and two Bearcat
> 895XLTs (!) for $45 a few weeks back. The 2004 has
> a bad display and one of the 895's 'scan' buttons
> sticks but the rest were in fine but used shape.

To make this work using multiple receivers, wouldn't it also require
multiple TNC's and serial ports as well as multiple instances of the Igate
software?

I guess it would be possible to combine the audio of all radios and send
it into a single TNC.

An alternative could be to use a single computer controlled receiver or
tranceiver. Assuming it's possible to obtain passtimes of PCSat, ISS, etc,
it would be possible to tune the receiving equipment to the desired
frequency for the duration of the overhead pass.

I found this http://www.geocities.com/hagtronics/2_meter.html homebrew
receiver which can be controlled via RS232.

Just thinking out loud and hoping to get some input into what's actually sane and practical to do. Great to be able to discuss this, I think :)

Message-ID: <LYR842-88602-2002.07.08-20.16.39--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello to all:

Alright here we go . I did a experiment with the RASCAL trying to operate PSK on 2 meters trying both FM and USB and it did not work .Meaning the Rig did not key up for the transmission. Now on normal HF bands the RASCAL operates beautifully.

Now here is the other part of the experiment . I did the same thing this time I used AGW and WinAPRS on the HF bands on SSB , guess what that darn things worked . I set up my extra HF rig and listened to the transmission if any and guess what I heard , PACKET , Now can some one tell me what the heck is going on ?

I know something has got to be wrong here folks because PACKET on VHF (2 meters) is normal operation. I know that there is PACKET on HF too but I have rarely heard it on the bands .

Maybe I should add this the ICOM 706mk2g has a I/O port in the back of the RIG and that is were the interface is plugged into for PSK and RTTY . Now I am beginning to think that I need to do something different here folks.

The ICOM has another port in the back of the rig it is a miniature 6 pin din plug just for packet I think and hope that if I can come up with some way of making a jumper cable from the 13 pin din plug from the RASCAL to the 6 pin din plug that I should be able to operate on VHF packet . ANY SUGGESTION?

Dave,
I run WinAPRS 2.61 as an IGATE and have noticed the same problem. It's just your RF traffic that WinAPRS will not pass to the internet stream...local RF traffic your station hears will be passed. I think this may be a minor bug in WinAPRS version 2.61 involving the IGATE's callsign's RF packets.

This may be a good option. Since the LCD is not the dimensions of a
typical Palm unit, I'm not sure how well the typical version of PocketAPRS
would run on it. I'm sure it can re-format most screens with text and
simple graphics, but I would be interested to see how it would manage the
map screens. Looks neat though.

I know your question was answered, but I'll throw in my $0.02. Yes, the
Earthmate does spit out Rockwell Binary, the only solution to that I know
of, is Byon N6BG's PIC based adapter the GST-1 http://www.byonics.com

As far as the eTrex, like i said before, I recommended a friend to buy one
for his TinyTrak and they mated purrrfectly! Standard NMEA output.

You lost me.

KC6ETE-1 (the igate) is getting into findu just fine, but it appears that
nothing it hears on RF is getting in.

Batteries America (http://www.batteriesamerica.com) has the battery
packs.  Look under battery inserts.  I have 2 HK-21's with the new
battery packs and they work great.  I also upgraded to the Paccomm 5.0
roms so I can use full KISS mode as well as being able to use them as
trackers.

Looks cool. PocketAPRS would run as normal in the center of the screen. It
looks as though "Dana optimized" apps run in full screen mode. Check out
the pdf spec sheet for more info. Too bad its not color.

Being a teacher and having wanted to incorporate palm handhelds into the
classroom, this looks like a good unit to that end.

If you have a Kenwood D7 or D700 then you can IGate everyrhing and also
be entertained by all the Voice ops whenever the voice sats come into
view too. But here is I think how you need to do it...

1) Run APRStk on any old laptop or PC
2) Run your favorite APRS software (with IGate capability) on another PC
   or in the background on #1 (stupdid question... does all the
   multitasking of Winders still work while running a dos program full
   screen?
3) Wire the pin 2 RXD data from the Kenwood to the inputs of both PC's
   or the TWO separate serial ports if trying to run them both on the
   same PC. Only connect the one TXD to APRStk pin 3...

*** Run the radio with the shortest possible coax to a 19" whip over a
reasonable sized metalic groundplane (screen wire or hardware cloth, etc)
Remember, the whip does not need to see the horizon so mount it lower with
shorter coax if you have the choice. But make sure it can see the sky
above say 20 degrees..

Such a ground station should hear all satellites above about 20 degrees...
With enough of these, then we would have the sky covered...

Yes, but that is another kettle of fish that we havent worked out the
details on. It does work just fine as transmit, but only if one station
is actually serving as the transmit IGate. We have demonstrated that
this does work. But before we would invite IGates to transmit in general
back up to the satelities, we need a nother layer of software to be real
smart about who and how...

So I would say, that is a few years away. So concentrating on RX only is
fine for anyone that wants to...

> I guess it would be possible to combine the audio of all radios and send
> it into a single TNC.

As long as the squelch operates fast enough. Most rigs do, so that is
not a problem as long as you dont have Pagers andother QRM that open the
squelches at the wrong times...

That is what APRStk does. It auto tunes the Kenwoods to any satellite in
view and also rotates a $64 radio shack rotator if you want....

Multiple instances of igate software? No. Easier ways to do it:

Xastir can handle up to 10 interfaces (more if you tweak one define
and recompile), so you could have nine radio/TNC's connected and one
network connection, or any combination thereof. Someone who really
wants to beat it to death could recompile for 30 or 50 interfaces.
Several multi-serial port cards are supported under Linux.
RocketPort cards work well.

I think aprsd can handle multiple radio ports as well. Someone
correct me if I'm wrong. I haven't used it for a while and when I
did I had only one TNC connected.

You might also be able to stuff several sound cards into a Linux PC
and set up the soundmodem software with 2 radios connected to each
sound card. This would eliminate a lot of TNC's.

In response to Bob's request for ISS IGates, I can provide one for
Southwestern Indiana. I don't have he best antenna for that work, but
can provide a Yaesu 2600 and KPC3-Plus.

It someone can send me detailed setup information, I can have one on the
in a day or two.

Thanks
AA9MM
Terry

X-Message-Number: 6

Now that ISS has returned to packet, we seemed to have lost some of our
permanent IGates that take the downlink and feed it to the internet and
thence to http://www.ariss.net.
On the last USA pass, I only saw packets being injected from the KE6AFE
IGate in California, nothing on the east coast. With the smaller
footprint of ISS, we need as many as 6 or more permanent IGates across
the
USA.

Well I was going to say bummer, since I was going to setup something this
week to get an illinois station on but I run aprsd. However, I should be
able to run a second instance of aprsd from a seperate directory and have
it just connect its data stream to my primary aprsd on the same machine
yes? I would have to alter the sockets that the ISS aprsd instance is
listening on but that is all in the .conf file anywya. Any aprsd operator
that see a problem with that?

Thanks for answering those questions. I've got a couple more.

1) Must the I-gate receive only data from the satellites, or can it receive terrestrial APRS also? You mentioned that the receive data will go to both ports, and I'm assuming that I wouldn't be able to have receive data from both the satellite receive and the land APRS receive on the same input for the I-gate APRS pc, but I just want to ask to make sure. My pc does have two serial ports, so I will try to run both APRSTK and the other program on that computer. APRSTK would have to run in the foreground since it won't go into DOZ mode (I already do this when I occasionally run APRSTK and DATA, with DATA dozing in the background.) It would be annoying at first having to stop and start TK everytime I might want to check the I-gate software, but might be a problem later. I could just find another old pc, so its no big deal.

2)I'm no antenna expert, so I'm wondering if the 1/4 wave ground plane antenna that you described has better high-elevation receive than a J-pole?
 I can receive fairly well with my J-pole, except for directly overhead. And would your Radio Shack rotator system with 2m and 70cm, 4 or 5 element beams be worth the cost for the higher gain (especially when monitoring UO-22) or not really necessary?

Sure, just tell APRStk to return to 144.39 when there are no satellites in view... That is the INPUT-MY-DEFAULT command...

  My pc does have

If you dont do the DOZ comand, then I think you can just alt-ESC from DOS to your desktop and do anything you want. APRStk will not run, but it will stay there and pick up running as soon as you re-click on the MS-DOS on the task bar...

  It would be annoying at first
> having to stop and start TK everytime I might want to check the I-gate

Shouldnt have to do that...
>

> antenna that you described has better high-elevation receive than a J-pole?

Certainly.  about 3 dB worth on 2m and about 8 dB worth on 70cm.  Its the
8dB gain on 70cm that makes it such a neat antenna, plus it is by
definition dual band....

No, not unless you just want to.  If we get enough IGates then everyone
only needs to receive the center of the pass over their house as someone
else will get it over theres.....

I tried that a year or so ago.   At that time there were a couple ports in the configuration
that weren't user configurable.  When I fixed that in my own version - it still didn't work.
Locked up on something.  I was guessing that some trick with named Mutex's or other
software scheme was still conflicting and thus preventing the two processes from running
simultaneously.

Much has changed since I first tried this.  It may work now.  It would be well worth
the time to give it a try and let us know.

73,
Bill - WA7NWP

On combining the receive audio from multiple receivers and feeding it to a
single TNC. To what extent would "collisions" be a problem? I'm sure there
would be a way to prevent it but, a simple idea is not simple no more.
Scanning receivers to a good job for the money however, even out here in the
Relative RF sticks of western Kansas they can be subject to interference and
other problems that, *I* wouldn't want to have an *MY* station.--73

That would work fine for PCsat, and ISS since the are never (<1%) of the
time overhead at the same time... But it would not work if one of them
was on 144.39!

Yes, but that is another kettle of fish that we havent worked out the details on. It does work just fine as transmit, but only if one station is actually serving as the transmit IGate. We have demonstrated that this does work. But before we would invite IGates to transmit in general back up to the satelities, we need a nother layer of software to be real smart about who and how...

So I would say, that is a few years away. So concentrating on RX only is fine for anyone that wants to...

> I guess it would be possible to combine the audio of all radios and send it into a single TNC.

As long as the squelch operates fast enough. Most rigs do, so that is not a problem as long as you dont have Pagers andother QRM that open the squelches at the wrong times...

> An alternative could be to use a single computer controlled receiver or tranceiver. Assuming it's possible to obtain passtimes of PCSat, ISS, etc, it would be possible to tune the receiving equipment to the desired frequency for the duration of the overhead pass.

That is what APRStk does. It auto tunes the Kenwoods to any satellite in view and also rotates a $64 radio shack rotator if you want....

If anyone is a tinkerer and wants to experiment with APRStt TOuch-tone to APRS conversion for special applications, and is willing to solder up a chip to a DB-25 as shown on the APRStt web page, I have some extra TTone chips...

Please dont ask for one if you only "might" play with it. I only have a few, and it is better to get these into the hands of someone that seriouisly wants to further explore this application... APRStt worked beautifully at Dayton, but I have been silent about it since, because it wasn't till yesterday that I found the chips! (The got lost in the flurry of activity leading up to Dayton)...

Is anyone else out there igating with this version?

It appears not to transmit RF traffic to the net, but it does transmit it's own.

Also, What would be triggering the "insufficient pointer space" boxes?

Rendered body type: text/plain

Bob,
I agree with the premiss that the current PHG circle calculation is flawed for moving mobile use and that there should be two circles and that the difference between the two is about a .5 multiplier.

BUT, since there are a multitude of different quality transmitters and receivers instead of just giving the user of a program a one shot only approach of dividing the range in 1/2 why not make it a USER definable parameter. That way the USER could tweak the value as needed to accurately represent the coverage area of THEIR station. I know when I am at home I want my home station to show TOTAL coverage and when mobile I want the map to show me mobile coverage.

I also found a major bug in the APRS+SA program and how it deals with PHG circles, but that is covered on the proper list.

The authors should make the PHG circles display the proper sized unless a "correction value" number is entered by the end user. (the authors could then DEFAULT it to .5 for your end result).

All DIGI operators should set PHG values to accurately reflect FIXED GROUND STATION HAAT 0 installations.
PHG range circle calculator available at:
http://www.cheavens.com/mark/radio/packetradio/PHGAPRS.xls

Plug in PHG numbers till you get an ACCURATE range (radius) for FIXED station use.

This has been an ongoing problem that I reported to the Sprouls over a year ago - WITH NO RESPONSE FROM THEM.

Based on the originating packet and a number of other variables, WinAPRS does not gate RF traffic to the 'net. This happens most when using AGWPE.

Rendered body type: text/plain

I'm fairly new at aprs and amateur radio, but enjoy the packet/satellite/aprs modes very much. Being new this should be a fairly easy question to answer based on the posts I've seen on the sig since I subscribed.

I'm running winaprs 2.4.6 on a win95 laptop going to a mfj-1274. It uses an icom-2100 and a 1/4 wave groundplane. Reception is excellant but my question is this. When I send a msg or receive a message many times it seems as if the entire message doesn't make it. Accodring to the docs, the limit is one line (not sure on the # of characters) per message, but that doesn't seem to matter. shorter msgs may be cut off and longer ones may go through or vice versa. there does not appear to be a pattern. is the problem on my end or is it a case of packets being dropped from one digi to another? I can't find any oprions for msg length so I'm, guessing it's the digi's. thanks for any help.

73 de Edward.

I would suggest connecting to an AHUB instead of one of the Core
servers.  That way if the one of the Core Servers went down, you
wouldn't be affected.

PRKRAZ 207.218.70.101:2023 is one AHUB, but there are others.

Of course that is just my opinion.  BTW, it sounds like you have
everything else set properly.

73s,
Eric KF4OTN

There is a PDF on the website that shows the wide screen split into 3 when
using graffiti.   So it looks like you can run it in "normal" screen
width. I didn't see anything about pricing. It would have to be $500 or
less for me to consider purchasing one. I already have two laptops, so I
would only purchase if the price was reasonable and I could convince the
spouse that I really need it. ;)

I have found that the HP jornada 600 series on ebay for around $200
if that helps. I am running APRS CE right now in the car with a pico
and a GPS hooked into a G71 from kenwood for portable work.
Just my $0.02 on the matter

Unless Xastir will run in a displayless mode it wont do me any good. Yes
I use Xastir as my client when I want to see what is going on out on the
aprs network. BUT  the machine I have devoted to serving as my
igate/wx/mail server is a P5-90 with 64meg of ram and RedHat 7.1. It
runs headless and w/o keyboard unless I need to service it in someway
that I cant from my main computer. My primary machine is only on when I
am in the shack doing interactive stuff.  That is why I run aprsd. I
havent delved into the intricasies of Xastir other than the basics but
was under the impression it didnt like not having a display. Plus I am
running my own weather collection utility that uses aprsd's udp sockets
for sending the weather data out to both rf and internet. I dont think
xastir will work for me the way I need/want to operate my setup here.

M.G. Publishing is offering to the public a revised edition of the Canadian
Subsidy Directory, a guide containing more than 2800 direct and indirect
financial subsidies, grants and loans offered by government departments and
agencies, foundations, associations and organizations. In this new 2002
edition
all programs are well described.

The Canadian Subsidy Directory is the most comprehensive tool to start up a
business, improve existent activities, set up a business plan, or obtain
assistance from experts in fields such as: Industry, transport, agriculture,
communications, municipal infrastructure, education, import-export, labor,
construction and renovation, the service sector, hi-tech industries,
research
and development, joint ventures, arts, cinema, theatre, music and recording
industry, the self employed, contests, and new talents.
Assistance from and for foundations and associations, guidance to prepare a
business plan, market surveys, computers, and much more!

The Canadian Subsidy Directory is sold $ 49.95, to obtain a copy please
call one of the following distributors:

Canadian Business Ressource Center: (250)381-4822, 8am-4pm pacific time.
Fureteur bookstore: (450)465-5597 Fax (450)465-8144 (credit card orders

Currently, I have the Sioux Falls Igate shut down due to various technical
reasons.   One being the lack of reliability of WinAPRS.

Again WinAPRS 2.x will gate to the net providing you are not running
through AGWPE.    Some compressed packets seem to get gated when running
AGWPE and some don't.   This has been verified by two other people on the SIG.

I have also found that certain stations that plot on WinAPRS do not gate to
RF (even when not using AGWPE).  This seems to be dependent on the
equipment used and packet types sent.

I have posted several messages about this to the SIG and to the Sprouls
privately, but have gotten little response from the Group and NO RESPONSE
from the Sprouls.  I also shared this information with Ralph Milnes and
George Rossopoulos.   I got a brief message back from Ralph, but never
heard back from George.

Personally, I have wasted enough of my time investigating this, especially
when bug reports get ignored by the authors...

73,

Mark

The VrzApDxw group in the Netherlands have the software you need to set
this up, checkout Digined.

http://www.homepages.hetnet.nl/~remko/software/diginedE.htm

In the documentation they have a worked example that shows how you can
configure a multiport digipeater to feed an Igate in linux.

I have been experimenting with a linux PCSat and ISS gateway for a couple
of months using Digined.   I have two radios that feed a type 2 DRSI card
in a linux box from 145.825 and 145.800.   The digined software grabs the
UI frames off these two ports and forwards them to a local loopback port in
my ax25 network layer, aprsd sits on the other end of this loopback pipe
and routes the information to the internet for me.   I can add any number
of ax25 ports to my system and then setup rules in Digined regarding what
is gated to the internet, between ports or back to the local channel for
that matter.   Still have to obtain/tune some cavity filters for the ISS
transmit frequency and get the system running on one antenna so that should
keep me busy for a while.

I hope to get the system onto the net  over the comming months, I may be a
little late for useful PCSat work but hopefully there might be something
else in the future to play with.   The possibilities are endless.

If anyone wants further information, let me know.

Regards

Matthew Cook

Speaking of Sat Gates, what antenna's have people used with PCSat and ISS ?
I have trialed 1/4 wave antenna's and have been less than impressed with
their overall performance.   Australia is very big so it is a long way
between Sat Gates so more horizon to horizon coverage I can pull from an
antenna the better.

I have been considering trying either a Moxon or Quadfiliar Helix and have
found quite a few designs for 2m off the net.   Has anyone built either of
these and had bad experiences or have hints/tips ?

The thing to watch out for here is if somebody sends an APRS message to
one of the stations you've heard via the satellite.   aprsd will probably think
it's a local station and respond by forwarding the message out your local
lan.   I had this problem when bringing some of the HF traffic over to the
local VHF circuit.   It's not a big thing but something to watch for if it
creates too much spurious local traffic.

Digi_ned needs a rule to create 3rd party headers to get around this.

We had some very severe wx go through central and western Iowa this morning
and not a single warning got issued via aprs. I can't recall this ever
happening before and I haven't changed anything recently here, other than
upgrading to ver 2.14 of APRS+SA. I don't think it's the software, because
the other Igate in our area running different software, didn't issue the
warnings either.

Is there something wrong with the national internet feed for wx warnings
that would explain this, or do I need to do some more digging here in the
shack?

(pse no peanut gallery stuff like "don't depend on aprs for safety"...I'm
looking for an explanation for the absence of warnings, not a discussion on
what aprs is or isn't good for.) 73

(Embedded image moved to file: pic17896.pcx)
What I'd like to be able to do is write a software serial port for
Win98 that
operates on the DTR/DSR or CTS/RTS lines. I know how to write the
UART code,
but I'm clueless about windows drivers.

Well, think about it for a second... Just how many signals are on an
RS-232 line? If you support status and flow control, right there you
bump your 9 pins. The DB-9 was just a convenient reduction for
physical space and the 'common minimum' for modem use on an
RS-232 port.

Of course, you can use any connector you want. Some people use
modular phone (6P6C or 6P4C, like HP with some of their printers
that were set up for office sharing), some use RJ-45. You can always
trade off 'something'.

   >Is it possible I FRIED the car computer by having a
   >BAD installation in the car?

   Possible, but not likely.
   You would have to induce enough RF into the computer to kill
   components
   that are designed to survive 400V alternator load dump transients on
   the
   external wiring.

   Directly coupling the antenna out to the computer's leads would be
   one way
   to kill it. Otherwise, I don't think you could transfer enough energy
   for
   anything beyond a minor upset.

   In my old explorer, if I ran >100W on VHF, the rear window wiper
   would come
   on by itself.

I doubt it.  Speed Radar that is.  It's VERY low power, and even has
trouble getting through some tinted windshields to be picked up by
radar detectors.  (Opps, sorry.  Radar detectors are still illegal in a
few
places, so "Application Specific Field Strength Indicators", ok?)

Besides, the computers are usually way down where they are really
shielded by the body of the vehicle.

Look for a bad connection.

Or...  Even fluctuating voltage.  A lot of new vehicles just feed the
```

potentiometer voltage to the computer to do things like the vehicle
heater. Sometimes it's not so obvious what they are doing in the
more modern cars, like my Intrepid. It reads some SWITCHES
by A2D! And in a LOT of new cars, the wiper is read by A2D.
Hmm, does your pulse wiper circuit pick up the slightest change
of your 'rate' and do a wipe? In the older systems with 'one-shots',
moving the rate of the wiper just changed the charge rate on the
cap in the one-shot, and moving it wouldn't necessarily trigger another
wipe immediately. On the newer systems it does. I wouldn't be
surprised if an A2D system was susceptible to voltage fluctuations
or even ground glitches...

On the other hand, wiper motors have a 'return to rest' feed to the motor.
If the motor is dirty or the contacts internal loose, it could get
activated
at weird times to make a single swipe.

It is wierd, but like the once a week single miss, not worth bothering
with. Interesting point, I understaand that in Va, "Application
Specific Field Strength Indicators", and scanners are illegal in
vehicles, unless you are a HAM.   They are legal in Md, and I'm not
sure about DC. No big thing, DC streets are so bad you couldn't speed
on them anyway.

Take it to the dealer...There is a service bulletin that covers this. Depending upon the production date it involves the wiper switch and possibly the "GEM" or "CKT" module.

Rendered body type: text/plain

Does any one know if there are any digis in southern ohio? I was on a
road trip yesterday and had the APRS side of the D-700 turned on, on the
return trip. On findu only one of my packets made it to the APRSIS even
though I was driving through areas that I know have IGates.(namely
Franklin, Northern Pickaway Counties) Any Ideas?

We need alternate and backup Weather Servers..   The advantage of Amateur Radio
is it's a distributed resource.   It would be good for a regional group
to be able to fetch and distribute their own Wx reports.

321. [aprssig] A voice for APRStt

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 10 Jul 2002 11:34:54 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88808-2002.07.10-11.13.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For APRStt, I now have my old DOS laptop speaking from a WAV file thanks
to a suggestion from Wes Johnson. Just 8 resistors on the LPT1 port gives
mic-level audio and the following QBasic code will speak an 8K mono WAV
file out the LPT1 port... no sound card, no Winders, no nothing...

Does anyone have a set of 8K WAV files for the numerals and alphabet
already so that APRStt can speak callsigns? Here is the QBASIC code:

```
----------------------------------------------------------------------
 N=2                        'adjust N for the speed of your PC.
                            'N =2 works for my 25 MHz laptop
 OPEN "xxx.wav" FOR INPUT AS #1
 DO UNTIL EOF(1)
    A$=INPUT$(1,1)
    OUT 888, ASC(A$)
    FOR J = 1 to N: NEXT
 LOOP                      'actually it should not start outputting data
 CLOSE                     'until the 60th byte, but out of 8000 bytes a
 END                       'second, the added code is not worth destroying
                           'the simplicity of this example.
--------------------------------------------------------------------------
```

Thats all there is to it!   The D/A resistors on the LPT1 port are:

```
pin 2 620K     'simply join all these together to a 390 ohm to GND
pin 3 330K     'and then insert a 10uF cap to be your audio output.
pin 4 160K
pin 5  82K     'the result is about 10 dB greater than mic-level audio
pin 6  39K     'giving you plenty of signal to trim down as needed
pin 7  20K     'Or use a 1500 ohm instead of the 390 ohm to get
pin 8  10K     'something closer to mic-level directly...
pin 9   5K
```

Duh... I guess I could put a voice now on APRSdos to speak when you have
new messages and so forth (it can only play back pre-recorded WAV files,
not actually read the messages...) But I dont see any real benefit to
this since APRSdos already sends you CW clues as to what is happening...
and it is a lot simpler... ANy suggestions as to any benefit here?

323. [aprssig] APRS Grows in Japan

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 10 Jul 2002 11:46:49 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org, TAPR APRS SIG <aprssig@lists.tapr.org>
Message-ID: <LYR842-88810-2002.07.10-11.25.15--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
N2LBT observed several APRS stations coming on line in Japan.  You can
look at all of them on the FINDU.COM web page and then just select "nearby
stations" to see all of them.

 http://www.findu.com/cgi-bin/find.cgi?call=JA1VSY-2

Its intersting to see the variety of APRS in use:

JA1VSY  UIview 50 mi NW of Tokyo
JK1MLY  MacAPRS 15 mi in W.Tokyo
JL1STM  WinAPRS a PCsat IGate on 145.825
JO3SEN  Kenwood 10 mi NW of Yokohama (two stations on the air)
JA1YKX  WinAPRS YOKHHAMA  (The Kenwood Club station)
JL1IBD  Kenwood moile in Yokohama
JA2HNR  UIview 22 mi NE of Shizuoka
JA2RLO  UIview 35 mi SE of Nagoya
JA2CMJ  UIview 18 mi SW of Nagoya

It won't take too many more stations on the air to form the critical
mass necessary to provide a live RF network since, in APRS, any home
stations are automatically a digipeater for everyone else.

FREQ is 144.640 MHz and typical digipeater paths are RELAY or WIDE or
WIDEn-N for the few that are UIview stations...

So if you are in Japan, and you have a radio and TNC (or soundcard and
recent APRS software that can use it), put those radios on the air on
144.640 MHz and lets get the RF network on the air!

I have no knowledge of this are, but what was your path set to?  You may have
gotten bit by the "No RELAY here, sorry" issue...

Maybe another use for the backup findu server?  It is my understanding
that we do have emwin transmissions in the DFW area (where the backup
findu server is).  Dale, would this be a possibility?

OOPS, the level is about 26 dB too strong for Mic-level.  To have the
output be Mic-level, change the 390 ohm load resistor above to an 18 ohm
resistor or so (not the 1500 ohm I suggested above)...

Well I have a Digi on the east side of Cincinnati (WB8NUT) and I have
driven from Cincinnati to the Dayton/Xenia area and have always gotten good
coverage along the entire route when checking on Findu.  Next week I'll
drive from Cincinnati to Akron so I'll be able to look at that.  Don't know
where you were exactly, but Southwestern Ohio has plenty of digis.

Southwest Ohio (Around north of Dayton down to Cincinnati, east to Xenia)
has excellent coverage. I've also gotten in fine when in Columbus, but I
don't know much about south of there.

Like the other guy suggested: check your path. I use RELAY,WIDE2-2 (or
maybe it's RELAY,WIDE3-3) in the tracker and it works pretty good.

There are several digis on the I75 corridor from northern Kentucky up to
Dayton.  However, north of Dayton on I75 and east of Dayton on I70 is
pretty much a black hole for quite a few miles.  In Dayton, the W8APR digi
has reasonable coverage and also provides an Igate feed.  All the main
digis in SW Ohio are WIDEN-N and as far as I know all support RELAY.

332. [aprssig] New beta of aprsd 215 available

From: Dale Heatherington <dale@wa4dsy.net>
Date: Wed, 10 Jul 2002 14:40:10 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-88824-2002.07.10-14.18.22--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A new public beta of aprsd 2.1.5 is up on wa4dsy.net.

Download it at:
http://www.wa4dsy.net/Files/aprsd215b2.tgz

Documentation is here:
http://www.wa4dsy.net/aprs/aprsdDOC.html

REVISIONS

2.1.5

Note: Some of these bugs were caught by the new compiler in RedHat 7.

1) Fixed charQueue.write statement in serialp.cpp. Now it passes the char as an integer in the cmd field.
It used to pass the char as a char pointer. This worked but was confusing.

2) Fixed charQueue.read() statement in aprsd.cpp. Now it reads the int cmd and then converts it to a char. (see #1 above)

3) aprspass.cpp: Added to the #includes list "stdlib.h" so it now compiles on RedHat 7

4) added a missing pthread_mutex_unlock() in SendFiletoClient(). Possible cause of lockups!

5) Fixed several instances where I had incorrectly used strncat. strcat is now used instead.
Checked for buffer overflows.

6) Changed the way the number of connected clients is determined. Now the sessions[] array is searched and active connections are counted each time this value is required. The previous code had a counter "ConnectedClients" which sometimes got out of sync with reality.

7) Fixed many instances where ostrstream objects could create buffers without terminating NULLs if filled beyond capacity. (no overflow, just an unterminated string)

8) Fixed bug in Mic-E converter that rejected latitude decimal minutes greater than .59 .

9) Added filter code in serialp.cpp to prevent ?IGATE? and ?APRSD? querys from being igated from RF to the internet where dozens of replies could be generated. APRSD still responds to the RF station but doesn't pass the query to any other igates.

10) Applied patches from Steve Price (KG4PGU) to make code more portable.
Didn't change to gethostbyname2_r() though.

11) Release a9: Worked on code that used gethostbyname2_r(). Removed mutex locks.
Added a test for return value == 0 in addition to hostinfo pointer not being NULL. Will this fix the crashing problem?
Answer, after a 500 hour test: NO!

12) Release a10: Replaced gethostbyname2_r with gethostbyname_r.

13) Added filter code in aprsString to reject "EH?" and "cmd:" packets.

14) Added "try" "catch" blocks to aprsString::AEAtoTAPR, split() and aprsString::changePath().
Now exceptions there will be caught instead of segfaulting.
Note there was no solid evidence these functions ever caused a segfault. Safety first.

15) 5-19-02 Removed directed query responses. Fixed general query "?IGATE?" response to comply with APRS spec 1.0.

16) Stopped sending System Status messages on Link port (1313), Message Port (1314) and to Hubs you have connected to. You will no longer get:
"aprsdATL>JAVA::javaMSG :Atlanta_GA Linux APRS Server: 127.0.0.1 connected 2 users online."
and other such messages on these ports. The BEACON packet will still go to all ports except the 1314 message-only port.

17) Added support for NOGATE in path. If a packet from any source has NOGATE or RFONLY in the path it will killed and not go onto the Internet. However, they will still appear

```
    on the raw TNC port (14580) for network debuging.

18) The server now adds information to the end of the PATH indicating the
    source of each packet .  This is the qAc,CallSign construct.
    See server docs for more details.

19) In the code that creates connections to other hubs (Server command) I added
    code to check that the sysop of THIS hub provided a valid passcode.  If not valid
    no data will be sent outbound.

20) Added error checking in thirdPartyReformat().  It now returns an
    error if packet wasn't valid AX25 or was already in 3rd party format.

21) Fixed problems with 3rd party packet handling.
    Now it works this way:

    A) Third party packets that have TCPIP in the
       3rd party header are rejected.

    B) Third party packets that don't have TCPIP are converted
       to normal format and put on the internet stream.

22) Restructured the aprsd.cpp file into three files.  All the aprs server thread
    code is now in servers.cpp.  The http server is in httpserver.cpp.
    Also cleaned up alot of sloppy usage of extern declarations.
    All externs are now in include files.

22) Added signal handler for SIGINT to allow graceful shutdown when running
    as a daemon.  Issuing a "killall -INT aprsd"  command properly loads
    RESTORE.TNC into the tnc and stops aprsd. Also, "service aprsd.init stop"
    will properly shutdown aprsd.

23) Added new keyword  "Server" to aprsd.conf file.
    It replaces the old "Igate" command (although Igate is still honored).
    A command such as "server first.aprs.net 23 hub-sr" defines the connection
    to first.aprs.net as a send/receive hub connection.  The user passcode
    is supplied with another keyword "pass".  See aprsd.conf docs for details.

24) Added a new class of port.  OmniPort defaults to 14600 and allows the USER
    to control which data streams he wants via messages or plain ascii commands.

25) Added a new page of data to the html status page.  Clicking on the users
    port number opens port filter status in a new window.  There you can
    observe which streams each user is being sent. This became important
    because of the new OmniPort and its user definable streams.

26) Added bandwidth controls.  Sysop may now specify the maximum allowed server
    load in bytes/sec.  New users are rejected when the limit would be exceeded
    and the latest high bandwith users are disconnected if the load increases
    beyond the specfied limit.  Keyword is "MaxLoad" in aprsd.conf .

27) TNC sysop mode can only be accessed from the new TNC Sysop Port 14500.
    Aprsd will now automatically put your telnet client into character-at-a-time
    mode for better operation with the TNC command line.
```

333. [aprssig] EASY SATgates for ISS/PCsat

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 10 Jul 2002 15:14:22 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org

Message-ID: <LYR842-88828-2002.07.10-14.52.33--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Dave McCarn reminded me that ANYONE with a D700 mobile can be an INSTANT
SATGATE with no other effort, no muss, no fuss, no PC.... Here's how:
----------------------------------------------
Subject: Easy, Easy SATGATES!
From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 8 May 2002 19:47:14 -0400 (EDT)
X-Message-Number: 12

Here is how we can have some EASY satgates almost overnight to support
worldwide distribution of UI digipeated packets via all of the ASTARS
satellites (see ASTARS web page):

Whenever you park your TM-D700 APRS mobile out doors, hit a PM as you
leave.  Your vehicle instantly becomes a SATGATE that is about as good as
it gets!  Here is how it works...

1) The 1/4 wave roof antenna with short coax will hear WELL (high passes)
2) With many of these, ignore the low ones, someone else gets 'em.
3) The TM-D700 does UI digipeating with call substitution
4) The digipeat is digipeated to 144.39 where it enters the normal APRS
    internet system!  (assuming an IGate is within range of your vehicle)

Thus, flip the switch when you leave your vehicle, and it just works!
Here is how to set it up in one  of your program memories (PM's):

1) Set a channel to receive the satelltie and XMIT on 144.39
2) Put "SGATE" in your APRS UIDIGI menu callsign list
3) Enable DIGIPEAT ON.
4) Put this in a PM so that you can also turn it OFF easliy too!

This works perfectly for ISS, SAREX, PCSAT, and SAPPHIRE. (Not UO-22
which is at 9600 baud)... [and now Sapphire is INOP]

*** NOTE *** This requires all USER packets to include SGATE,WIDE in
their path such as:

  Via SPACE STATION: VIA ARISS,SGATE,WIDE
  Via PCsat:         VIA W3ADO-1,SGATE,WIDE

In general, adding SGATE,WIDE as a final hop is not a bad idea in all
cases for anyone wanting to get into the internet to allow for just these
kinds of one-hop forwarding of Space digipeated  packets.  I use this
technique frequently at indoor demos to digipeat  satellite packets from
my car in the parking lot to indoor displays...  But it does add 14 bytes
of overhead to every packet... But if you want your packet to get to the
inernet, it is good insurence...

The only way to do this for UO-22 (at 9600) baud is to have an umbilical
cord by your driveway and plug your D700 into your IGate PC
everynight...

Oh yes, also, the best antenna is a 19.25" whip on your vehicle roof to
get good gain overhead.  Few people run these basic antennas, but run
5/8th or other gain antennas.  These put the gain on the horizon where it
is useless most times for mobile satellite work...  ALso, the 19.25" whip
antenna in the center of your roof has great overhead pattern and gain
for
both 2m and UHF!  SO it is great for UO-22 as well as the 2m birds...

Remotely related to APRS....

Anyone here have a circuit (or a URL to such a circuit) that compares the phase difference between two antennas (cheap)...

I'd need to be able to compare the phase of an RF signal at two different antennas that are closely spaced. And I can't use an o'scope to do it... what I need is a two input vector voltmeter (like an HP8508A) but do it for less than the $5k that a used 8508 costs...

The purpose will be for DF... and cheap doppler is not accurate to a few degrees... nor are the other cheap handheld approaches...

I need a couple of degrees accuracy... and as the antennas are fixed mount... and the signal wavefront may be nearly orthogonal to the antenna site... the accuracy is critical.

It will be the same signal "hitting" both antennas, and the feedline from both antennas will be exactly the same length (TDR measured) - feeding into the vector voltmeter circuit... if I can find one...

Cheap please.....

TNX in advance

Sounds like a resistive combiner will get you there.
Fix one antenna, move the other, when you get max signal, then you're in-phase. Measure the difference in position, and you have the original angle.

There was some kind of project, sounded similar, in QST awhile back. If
I remember right, it used an RF switcher driven with an audio freq
circuit to 'switch' between two antennas. There was some kind of 'phase
sense' circuit that provided DF accuracy to within a couple degrees.

"A Fox-Hunting DF Twin 'Tenna, October 1998 QST"

Maybe it's adaptable to what you're after.

EIA RS-232 specifies an optional second serial port that was rarely implemented. The
nine pin standard initiated by IBM is for a single serial port.

The aprsd udp weather thing sounds interesting. Do you have some
information on how that is done?

Adi

USMC Historical Division Seeks MARS Operators

A project for the USMC Historical Division is seeking written and oral histories of service and civilian personnel who participated as operators in the MARS (Military Affiliated Radio System) program using phone patches or MARGSGRAMS. The main focus is Navy/Marine Corps MARS during the Vietnam Era, but contributions from all services and eras are encouraged. The exhibit is also seeking artifacts from the exhibit (at MCRD San Diego) such as photos of stations and personnel, orders (DNC-8), etc. Those who would like to contribute to the exhibit can contact the MAR should email or write to the below address:

MARS@borgmangroup.com

I had forgotten about that approach.
That will give you a tone amplitude (phase modulation) whose amplitude is cos(angle)

Just checking my system. I copied 43 packets from you over 34 miles. To get to an Igate can sometimes be difficult from the Columbus area. Your packet either has to go east to Newark or west over to Dayton. On my trips down to Athens area, I get digipeated regularly by KA8ZNY-4 and -10. Usually anything that get's repeated by ZNY will get over to the Newark

Igate. From your trail it looks like you came up US23. So basicly you were in-between the ZNY digi's and the other further west at Washington Courthouse.

Josh Gould wrote:

Rendered body type: text/plain

Okay...I think I've got this working. I'll just have to wait until morning to see if I receive and gate anything from the ISS and PCSat passes tonight. I built a cable that goes from the TH-D7 to two separate serial ports, one with receive only. I actually built the cable right the first time! I have APRSTK running on my pc (with APRSDATA still running w/o problems in the background), and APRS+SA running on my laptop and acting as the I-gate. I tried to use WinAPRS, but I couldn't get it to connect even after trying to update its internet server list. I've already tested out the connectivity to findu.com by monitoring local APRS and checking it online. I would like to ask how findu.com knows to put data on the ISS and PCSat portions of the site. Does it look for RS0ISS or W3ADO-1 in the path? Or do I need to set my I-gate up in a specific way? Following that same thought, since there is no page specifically for UO-22, what will findu.com do with the packets that it sees from it? I'm still running on my J-pole, but I'll have the 1/4 wave GP up soon.

> Unless Xastir will run in a displayless mode it wont do me any good.

There is a way. You can start it up under VNC from another computer, then disconnect. Xastir will continue to do it's display thing to the VNC display. When you next connect up from the remote computer, you can see what the current Xastir display looks like. Some people use VNC this way to monitor their home Xastir from work. I use it at work to connect from my Linux box over to a Windows box occasionally.

You could use Xastir to gain your multiple ports, then have it talking
to aprsd.  That way you can keep using your udp sockets as well.

CRAIG REPLIED:

Matthew, not sure if you're asking about mobile or
fixed IGATE antennae.

I use PCSAT and ISS from my motorcycle. I understand
from Bob's posts that a 1/4 wave whip over a car roof
is a better antenna, but I don't have the ground plane
nor the height to pull this off. I use a 5/8 wave whip
which seems to have no problem working the sats.

I oftentimes cannot HEAR the sat, but always am able
to hit the bird if the pass is decent.
```

I have mine hooked up as of last night also. However, have watched about 6
passes and have seen only pbbs traffic. Have not seen anything resembling
aprs. Also beginning to wonder if the doppler shift and my radio are
causing oddities. I seem to only see packets as ISS is moving away from
me.

Any ideas why I might not see aprs packets? I am running aprsd on a Linux
RH7.1 box.

```
Topic:  Radios at camp...

Having just returned from a great experience of demonstrating Ham Radio at
my son's boy scout camp, but the previous week having my daughter's HT
banned from a 10 day Appalachian Trail group adventure, I think it might
be a good idea for the ARRL to publish a standard Pamphlet called HAM
RADIO AT CAMP that discussses the advantages of HAM radio and addresses the
differences between HAM radio and FRS and Boom Boxes in simple terms.

A draft of the Phamplet will be maintained on the WEB page:
http://www.ew.usna.edu/~bruninga/hratcamp.txt

Following is a text copy of the draft if you are interested...  I invite
any substantive improvements or simplifications on the wording...

de WB4APR, Bob

***************************************************************************
* This is a two sided pamphlet for use at ALL camps.  Side one discusses *
* Ham Radio at camp and how it is excluded from the list of prohibited   *
* electronics at camp and the other side is the Scouting FRS Radio Code. *
***************************************************************************

HAM RADIO AT CAMP                                                   Side 1
---------------------------------------------------------------------------
                                                                    WB4APR

HAM RADIO is not a boombox or a video game or a toy.  Ham Radio is not
anonymous and nothing at all like a "chatroom".  Individuals on the Ham
Radio bands are licensed and uniquely identified by the Federal
Communications Commission (FCC).  Such individuals have studied radio
technology and operational techniques and have passed a test demonstrating
their knowledge of the communications art before licensing.

HAM RADIO is a licensed two-way radio service for local, national and
international communications and especially for emergency communications
where normal means of communications are lost or are not available.  Ham
Radio operators pride themselves in the ability to communicate and
practice their emergency communications skills out in the field whenever
they get the opportunity.

HAM RADIO operation from camp, in the field, on hikes, or on trips is
fundamental to exploring the limits of communications under a variety of
conditions.  In this case, Ham Radio is NOT included in the list of
prohibited items at camp such as "electronics, radios, video games boom
boxes, and other entertinament electronic devices".

HAM RADIO can serve several opportunities at camp besides just emergency
communications and  operating from field situations.  Examples:

  * Hiker communications
  * camp-to-camp communications
```

- Radio merit badge operations
- International awareness and communications
- Geography and topography effects on radio waves
- Hidden transmitter hunts and direction finding
- Radio Sport (a combinateion of DFing and orienteering)

HAM RADIO walkie talkies should not be confused with the FAMILY RADIO SERVICE, which is similar to CB in that it is an unlicensed radio service for the consumer with no individual identification nor individual responsibility for proper operations. Any restrictions (if any) on the use of walkie-talkies at camp must consider the distinct differences between these two services in the decision process.

This is not to say that FRS does not have great potential at camp. In fact, FRS when properly used can also serve many viable communications needs at camp and as an excellent introduction to radio as long as everyone who uses FRS properly identifies his transmissions and operates responsibly. See the Scouting FRS Radio Code on the reverse of this Pamphlet.

SHACKS-FOR-PACKS (and troops and posts) is a program to encourage the permanent installation of HAM Shacks at all camps. These shacks are just simple pre-fab 8x8' sheds which provide a gathering place for kids to learn about radio from any camper or Mom or Dad that has brought his HAM equipment with him. The shack provides a permanent place, an antenna and sometimes a 12 volt power system. Equipment and security is provided by whoever is currently in camp. Thus, the shack is intended to remain open at all times. The only permanently installed electronics will be an FRS base station on the scouting FRS channel 12. For more information see http://www.ew.usna.edu/~bruninga/shacks4packs.html.

SCOUTING FRS RADIO CODE Side 2

WB4APR

The Family Radio Service is ideal for Scout communications. Packs, troops, posts and camps should adopt FRS and encourage Scouts to learn the fundamentals of radio technique for practical, efficient and safe communications. FRS consists of 14 channels and 38 squelch codes which combined, yield 526 ways for people to NOT be able to communicate with each other without prior agreement on their settings. This is OK for a family, but contrary to many potential applications for radios in and around camps and Scouting.

FRS radios are not toys and should not be used as such. Scouting is the ideal place to teach the fundamentals of radio techinque to all kids.

FRS designers assumed consumers would use FRS like a cell phone for one-on-one calls. That is why they have the irritating RING tones and there is no mention of proper "radio procedures" in the instructions. But for Scouting, FRS radios are used as RADIOS and Scouts need to understand proper radio procedures when multiple people share a channel. To use FRS effectively AS A RADIO and for safety in the wilderness, the following guidelines are recommended for all Scouts.

1) For general communications purposes with many users, do not use the CALL buttons, or RING tones. They are irritating, and they cause people to turn their volume down, or turn the radio off. This eliminates the value of a radio to communicate. To contact someone, use their callsign.

2) CHANNEL-1 TONE-0: At each new outing or venue, begin communications on channel 1 tone 0 (tones off). This is the universal FRS calling channel. If it is quiet, you may meet fellow hikers or Scouters, and you are serving others by monitoring this channel for emergencies.

3) SCOUTING CHANNEL: If channel 1 is too busy for peace of mind, change to channel 12, the Scouting channel. Remember the 12 points of the Scout law. If channel 12 is too busy, then set tone 5 for the 5 words in the Scout slogan. With this setting you will typically only hear other Scouters in busy areas. But in general setting TONES to anything but off makes it difficult for you to monitor the channel and keep aware of what is going on.

4) CAMP CHANNELS: At camps or Jamborees, choose your channel and tones to match your troop numbers in accordance with these guidelines so that someone trying to reach you can also figure out your channel and tone in case somone needs to contact you. Use the first two digits of your troop for your channel if possible. If these are above "14", then use only the

first digit. Do not use tones. Set tones to 0 or OFF. If you must silence the channel by using tones, then use the next two digits of your troop for your tone. If above 38, then use only the single digit. Using these rules will make it possible to always find your frequency if someone needs to contact you.

5) HAM CHANNEL: One other channel that may be interesting to Scouts wanting to learn more about radio is channel 7 tone 3. That is where HAM radio operators on FRS may hang out if channel 1 tone 0 or the scouting channel is too busy... Again, only set the tones if you have to...

6) CALLSIGNS: Radio communications work best when everyone can tell who is talking. Eliminating anonymity eliminates much of the abuse on the channel. It is best to use callsigns and to begin any new conversation with standard radio technique of saying the callsign of the person you are calling followed by "this is" and your callsign. Choose good callsigns such as your troop number and your initials. For our Troop 995, for example, "995AJB this is 995REB, over".

7) TEACH, NOT SCOLD: Never be critical of someone over the air. Teach proper radio technique by setting a good example and by instruction to new Scouts. Remember with 38 squelch tones, the chance that the other person will hear you is less than 3%. If someone is acting improperly, the number one rule is to ignore them. If you respond, then you are only encouraging further abuse. If you ignore him, however, he will get bored and probably go elsewhere.

8) FRS NIGHT: Every WED nite at 9 PM everywhere is FRS night. This is a time to meet new radio friends who are also looking to see who else is radio active in their area and wants to learn more about radio. Just go to channel 1 tone 0 and call "CQ FRS NIGHT, this is xxxxxxx, OVER".

9) MOVE UP TO HAM RADIO: FRS radio is limited in range and power. If you enjoy radio and want to increase your range as well as make new radio friends and to even make phone calls from your radio, get in touch with HAM radio operators and learn all about the exciing world of HAM radio. See the web page at http://www.arrl.org.

10) PLAY IT SAFE: FRS radio is a great way to meet new friends and learn about radio. But it is unlicensed and you have no guarantee who may be on the other end. So be smart and use the same safety precautions as with any strangers. Do not reveal any private information and do not meet any stangers in any unsafe location. Only communicate with others who properly identify themselves.

To encourage radio communications at camp, many camps are installing "HAM Shacks" permanently in camp, and these shacks include FRS equipment for introducing youth to proper radio techniques. See the SHACKS-FOR-PACKS section on the reverse side of this pamphlet.

```
************************************************************************
* These guidelines for FRS and Scouting are only a draft.  They are not  *
* yet endorsed by any scouting organization, but we hope to encourage    *
* their adoption.  To keep up-to-date on any changes to this plan, visit *
* our web page at:  www.ew.usna.edu/~bruninga/frsplan.txt                *
*                                                                        *
* Teaching familiarity with this RADIO CODE should be one of requirements*
* in the scouting program.  I would suggest Tenderfoot.  FRS radio can be*
* a powerful tool for Scouting, but unless we teach radio technique, FRS *
* will become just another noisey toy, banned from all Scout activities  *
* at great loss to the Scouting program.                                 *
*                                                                        *
* Enjoy radio, learn more, and move up to HAM radio!                     *
* Bob Bruninga, WB4APR, Eagle Scout.                                     *

```
I saw you on PCSat at around 1925z sending a couple of messages.  It was a
good pass for my location, but I was only able to gate one station,
N9IDH-9.  I heard nothing until just before it went overhead and then
afterwards when it started descending.  TK had the radio on 145.83 while it
was heading towards me, and .825 after it got overhead.  Might there be
another reason why I could only hear it while it headed away from me?  It
also sounded rather weak, at least compared to how it sounded last month.
I'm assuming that's due to the battery problems that you mentioned before.

I also noticed that when UO-22 passed over this morning (in the 1200z
hour), all that TK heard was what I assume to be control data from the
satellite.  It only recorded the callsigns of UOSAT5, UOSAT5-11, and
UOSAT5-12.  My APRS+ did not record any of that, but I don't think it does
anything but standard APRS data.  If there were any other stations on it at
that time, it did not hear them.  UO-22 will be coming over again at around
2335z this evening, and hopefully someone will try to get on and send some
APRS over it.  I would try with my D700, but its being used right now as
the APRSDATA radio, until I get another TNC to go with my other VHF radio
to be dedicated for that duty.

One question about that 1/4 antenna.  For mobile use (on top of a pickup
cab), would the $30 Radio Shack 5/8 wave 2m mag-mount antenna, trimmed down
to 19" (with proper tuning), come close to what you described before?
```

For all SATgates:

We need to have all SATgates to self identify so that we can maintain a
database (or live web page) that shows all the currently active SATgates.
One way to do this is to make sure that everyone includes the word SATGATE
in their Position comment field. THen we can just monitor the worldwide
APRS feed and capture all such stations to a WEB page at any point in
time....

I would also ask that such IGates use the GATE Icon with an "S" overlay
instead of the miss-used TCPIP Icon which was never intended to be used
for the "internet" but only to indicate an ON-AIR TCPIP protocol station

The correct ICon for an IGate is a GATE with an "I" overlay...

Where do these icons show up. Are they somehow viewable on findu.com?
Also, are there any non-java web application that do what findu.com or
javAPRS do?

```
I have written a simple NMEA GPS program.  It's really simple right now but
I plan to add more.  You can download it from my site at
http://www.ke4nyv.com just follow the link on the main page to my Software
page.

73's
Jason KE4NYV

Yes, it only enters sunlight 10 minuts before AOS here, so sometimes it
is not till middle of the pass that it is charged up enough...

It is th echicken or egg.  No one uses UO-22 normally for APRS, but as
PCsat dies and as we get more SATGATES on line, then they will.  You are
LEADING the effort!

Thanks!
Bob
 UO-22 will be coming over again at around

They show up in APRS applications. Steve has begun experimenting with displaying icons on findu.com

> Also, are there any non-java web application that do what
> findu.com or

findu.com is a non-java web application.

> javAPRS do?

Java is the only cross-platform tool that provides the ability to actually run an application in your browser. There are other technologies, such as Flash, that provide similar capabilities but none of those provide the network real-time connectivity that Java does (at least, that is my understanding).

The current javAPRS runs on IE and Netscape browsers across all platforms. If you have other ideas on a technology that works across multiple platforms with real-time network connectivity in a browser, I would be interested in looking into it.

Rendered body type: text/plain

I am a total novice with UI-view, and am trying to run UI-View16 without any radio connection, i.e. it is connected only to an internet APRS server.

In "comms-setup" I have set comm port to "none", because I don't need any form of radio connection.

It connects to the aprs server, and displays the stations received from it, and also sends regular beacons to the server. But if I open the message window and type a message, it doesn't get sent to the server. I have

checked "Gate local messages" in the "APRS server setup", and now I've run
out of ideas.

Am I trying to do the impossible?

Paula, I would highly recommend stepping up to the 32 bit version. To me,
there is a major difference.
When sending a message, try port I and in the letter I.
Can't recall sending a message with the 16 bit version but the 32 bit
version opens up another world!

365. [aprssig] MAC Serial adapter on a SPARC IPX?

From: "Bob D." <n2iph@comcast.net>
Date: Fri, 12 Jul 2002 05:00:07 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89020-2002.07.12-04.42.46--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone know if a the Palm docking cradle adapter made for
use on a MAC will work on a Sun SPARC IPX ? The IPX has the
mini-DIN serial ports like a MAC. Is this adapter (mini-DIN to DB-9)
made only for use with the Palm, or will it work with other serial
devices? I was given one by a friend who recently purchased a Palm
and does not need it. I'd like to use it to connect a TNC to the IPX
and be able to work packet with it. The old IPX is just sitting here
and I figure it would make a good packet station in place of wasting
a faster machine as a terminal.

TNX for any help,

Bob D.
N2IPH

> (diamond) next to it.

OOPS, good point. Historically there was only the primary table, and only
the HF GATE Icon (/&). But then when we added the alternate table, the
intention was that the GATE DIAMOND (\&) would be used for all types of
gateways and the type of gateway would be shown by the OVERLAY character.

  H = HF GATE
  I = Internet Gate
  6 = 6 meter gate etc....

Now seeing that the actual table entry was only named "DIAMOND" in the
spec now explains why so few people use it for GATEWAYS. In the future I
will make sure to spell out that the DIAMOND is the GATEWAY ICON...

Thanks for highlighting this error...

367. [aprssig] aprsd215 beta 4 available

From: Dale Heatherington <dale@wa4dsy.net>
Date: Fri, 12 Jul 2002 11:25:59 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89039-2002.07.12-11.04.16--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
aprsd 2.1.5 beta 4 can be downloaded here:
http://www.wa4dsy.net/Files/aprsd215b4.tgz

This version compiles with the new GNU C 3.1 compiler.
It also still compiles with 2.95.

I also made doing Mic-E conversions more difficult.
The sysop must not only set "ConvertMicE yes" in the
aprsd.conf file but also change "#define CONVERT_MIC_E FALSE"
to "TRUE" in constant.c and recompile.
I added a new status field on the port 14501 html status
page "Mic-E Conversions YES/NO".

So far there have not been any reports of problems with
beta 3.  If beta 4 does not generate any significant
negative reports I'll release aprsd 215.

Rendered body type: text/plain

```
To have APRS+SA insert your callsign, you need to set the following items in
Settings.
Config section - set BitMask to 32.
IGate section - set AddUniqueID to 1
     and set,  UniqueID to   AD5ER,I
```

Next version will remove the BitMask requirement which is a relic from when there was less agreement on how to identify IGates.

Rendered body type: text/plain

Ok, I'm looking for an inexpensive weather station to use at a remote site for APRS. If anyone knows of a good one that won't break my bank, please let me know. Also, anyone have any idea of how to build, or know of where I could buy, a wave height indicator?

I have a boat that is about 60 miles away. Before I leave, I would like to be able to check my APRS screen and see what the temperature, Barometric Pressure, and wind speed/direction are. I would also like to know if the Sound is choppy or slick (the difference in 1/2 ft. seas and 3 ft seas!). Anyone know how this could be done and then reported to the APRS network?

73s,
Eric KF4OTN

371. [aprssig] Re: Ham radio (and FRS) at Camp

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 12 Jul 2002 12:17:52 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org
Message-ID: <LYR842-89045-2002.07.12-11.56.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Having been to camp this week, I have a new perspective on:

> SHACKS-FOR-PACKS (and troops and posts) is a program to encourage the
> permanent installation of HAM Shacks at all camps. These... simple
> pre-fab 8x8' sheds... provide a gathering place for kids to learn about
> radio from any camper, Mom or Dad that has brought his HAM equipment...

As a Dad, on arrival at camp for my one night tour of duty, I was told that my job was to sit in the campsite (rules require 2 adults present). THus, setting up a demo station in a central location (the mess hall) was out for the evening I was there...

As I was schelping my equipment down the trail to our campsite, I saw a suspiciious white rope going into the trees at a nearby campsite and followed it to a dipole, coax and another HAM! But no one outside of his troop knew it was there.

So here is the new cheap alternative to SHACKS-4-PACKS to give visibility to HAM radio in camp with greater flexibility. Simply prepare a permanent big sign in a central location that says something like:

```
+--------------------------+
|  HAM Station this week   |
|                          |
|     ***************      |
|     * ON THE AIR  *      |
|     ***************      |
| is operating at campsite |
+-------*---------*--------+
        *         *
    +---*---------*---+
    |  Davey Crocket  |
    +-----------------+
```

Actually it would also have a place for the operator to put his QSL card to identify who he is and it would also probably have a little note that says the HAM station is montoring 146.52 and FRS channel 7 tone 3 and an invitation to "come on down"...

Thus, everyone at camp will konw if HAM radio is currently being demonstrated and where. ALso, since an FRS radio is less than $20 these days, I would make the ON-AIR sign be RED and BACKLIT and hooked to the FRS squelch and a 15 minute one-shot timer so that I could trigger it to be ON remotely whenever I am on the air. Thus saving a hike to the mess-hall at the start and stop of each operating session...

The advantage here is that each HAM can do his thing WITH HIS TROOP in place at his campsite, yet still give the overall camp the visibility of operations. A problem with the shacks-4-packs concept is that the operator there must be independent of any other collateral duties since he is stuck at a central location.

I would make the sign about 1' by 2' and use a router to make it permanent on thick wood. The individual campsite plaques would hang below it... The sign should probably have a place on the back to keep all the unused campsite boards when not in use... Now, where to find the back-lit ON-AIR piece of red glass..?

See the design http://www.ew.usna.edu/~bruninga/shacksign.jpg

So anyway, I just thought I would post this ON-THE-AIR sign idea as a cheap and simple alternative to the SHACKS-4-PACKS idea....

Subject: [aprssig] Weather Station question...

Ok, I'm looking for an inexpensive weather station to use at a remote
site for APRS. If anyone knows of a good one that won't break my
bank, please let me know. Also, anyone have any idea of how to
build, or know of where I could buy, a wave height indicator?

Eric! Check http://www-frd.fsl.noaa.gov/mesonet/ before spending money.

You might find there is a station already near your location that could give
you the information you need.

Currently, there is no low cost method of getting a weather station onto
APRS. Some say the 1-wire is the way to go but by the time you buy
everything you need for it, you could go out and 'also' buy one. And, I do
not think it does any pressure readings yet.
The Peet Bros U2000 is probably your best bet, only because it interfaces
with an APRS TNC hassle free....that is about $367. And if you want
humidity, that is another $100.00 for that sensor! And, with that sensor,
you need to build a solar shield, or buy theirs...another $20 to $50.
So, with a radio, TNC, power supply, coax, etc., a weather station that will
give you more the wind and temp, you are looking at somewhere near $600.00.
of course, if you can scrounge the radio and tnc, that will save you some
money. I've done a lot of research on this subject and my numbers are very
close to being right on!

Okay. I set all of the settings as you indicated, but it is still
forwarding packets to the internet exactly as it sees them. I've been
connecting to port 1314 on the servers since I don't want to receive from
them, but I did try it while connected to port 23 of first.aprs.net, and
still no joy. Might I have missed an obvious setting somewhere else,
and/or do I need to be running a registered version of APRS+ for this to
work? Thanks for your help with this!

```
[ The following text is in the "iso-8859-1" character set. ]
    [ Your display is set for the "US-ASCII" character set.  ]
    [ Some characters may be displayed incorrectly. ]

To have APRS+SA insert your callsign, you need to set the following items in
Settings.
Config section - set BitMask to 32.
IGate section - set AddUniqueID to 1
     and set,  UniqueID to   AD5ER,I

Next version will remove the BitMask requirement which is a relic from when
there was less agreement on how to identify IGates.

I would like to add one thing about WX stations, and it may not apply to all situations and locations...

But I've found that rabbits love to chew on small gauge wire that's low to the ground. Telephone cable, Christmas tree lights, and WX Station cable seem to be the favorites. For some reason, they leave Coax alone.

Before putting in a WX station you might want to consider where to run the wires, and do so so that the wires run more than 4 feet the ground or run them through some kind of conduit.

Owning several bunnies I can vouch for this comment.

It's a bunny thing, and it beats me why they don't eat coax,
They eat everything else in their path!

I would recommend conduit as your first choice.

I don't know about that! A ham friend of mine had a pet rabbit that chewed
through 3 separate runs of RG-8, knocking out an 80-40 dipole, a 2-meter beam
and a Ringo Ranger in a single weekend!

Rendered body type: text/plain

I looked back through a week or so of PCsat data and see the following permanent IGates apparently on line as determined by their callsign,I insertion.

KE6AFE-11
KF9X-5
KT6UK-2
W1TYL
DF5FF-10
PE5YES
ZR1CBC
ZS7ANT

I also saw a few packets gated via these stations who may only be home stations doing an occassional pass..?

FF6WAX-1
KF4OTN-1
N3GXH-1
N8NOE
VE3XZT
VE2MGJ
WB7AWL-00
WP4LBK-15
WB8NUT
WH6SJ

These are all of the IGates that are using callsign insertion to identify their packets. Igates (WinAPRS) that do not do this, are not identifiable and so do not show up here. If you are running a permanent SATgate and dont show up, let me know.

I have been told that it's related to the lack of salt in their diet.
Ground squirrels will chew on wires also.

If I had the choice of conduit or salt blocks I would use conduit. HI

Last summer I was in the Boy Scout camp for a week as an adult leader, and carted my K2 along. It worked out great, as our week overlapped a bit with the national jamboree. I took a 17ah battery along and it ran the K2 for a whole week with about 3 or more hours of use per day. Didn't transmit THAT much, but enough...

Had a few visitors to our tent. We had mess-hall dining that week, and the camp staff saw fit to announce that I was 'on the air'.

I think it depends on the individual. Over the years I've had about a
dozen
or more cats, but only two of them would 'chew wires'.

One I cured when it was on my train set (I was in high school) and the cat started chewing on a wire leading to a crossing gate. So I turned it on. Well, the cat went straight up in the air and came down in a puffed up fur ball configuration hissing and spitting at the wire. Never chewed a wire again.

That was over 30 years ago. Then I got a kitten 2 summers ago and it chewed on everything. Including a 110v cord to my reading light. You should have seen the ball of spit an fury that suddenly appeared when she broke through the insulation! Did she stop? No way. AFTER that I would still find cords chewed through... I think she liked the taste of electrons. She chewed through my charger for my cell phone. And then on the following nights kept chewing more and more away. She wouldn't touch the 'free' end. I really do think she liked the electricity.

First, are you aware that NOAA has a fairly good system of automated weather buoys scattered around the entire US. Most are just offshore, some are in more densely populated high traffic harbors. You might find the wave height info for your boat nearby, already reported. They report everything you've asked for. Here's the link:

http://www.ems.psu.edu/wx/findbuoy.html
(I think somewhere on this site they have a link to display a map of buoy positions where you can just click to select the most recent obs.)

To build a wave height instrument you'll likely be going down the accelerometer route. I have no idea if inexpensive and fairly accurate sensors are available. You might run into a problem with insufficient bytes available within the weather packet to broadcast your additional data field. Need to ask Bob or someone who's expert in the spec.

As far as inexpensive wx stations, you can't get much less expensive
than a Radio Shack WX200 or the identical Oregon Scientific/Huger
WM-918. They can be found new on eBay for under $175 and have a full
compliment of sensors. Rather power hungry, though. They make a solar
powered version which is about twice as costly but maybe better suited
to your application. Just do a search on eBay for "weather station".

Is your boat tied to a dock or is it moored/anchored? If it's not at a
dock how will you compensate for the changing heading of the boat as it
swings in wind/current (thinking wind direction here)? This is assuming
you'll mount the sensors on the boat...

I wouldn't worry about baro pressure, the difference between you and the
60 mile away boat will almost never be significant or even accurately
measured with the precision of any hobby instruments which usually have
an error of around +/- .03-.06 inches.

73's
Ray - WB3ABN
Kingston, WA

Subject: [aprssig] Weather Station question...

Ok, I'm looking for an inexpensive weather station to use at a remote
site for APRS. If anyone knows of a good one that won't break my
bank, please let me know. Also, anyone have any idea of how to
build, or know of where I could buy, a wave height indicator?

I have a boat that is about 60 miles away. Before I leave, I would
like to be able to check my APRS screen and see what the temperature,
Barometric Pressure, and wind speed/direction are. I would also like
to know if the Sound is choppy or slick (the difference in 1/2 ft.
seas and 3 ft seas!). Anyone know how this could be done and then
reported to the APRS network?

73s,
Eric KF4OTN

If you have a pet that chews wires, try putting some Tabasco sauce on a
cloth and liberally wiping the wires down. Give it a good coat. When I've
done this, they stop after the first chew.

I read somewhere that a manufacturer was developing a wire jacketing system
that incorporates capsicum pepper extract. They stated that NO animal
likes hot sauce...

I had a Boston Terrier that loved Tabasco, btw. I bet you rabbits,
skunks, racoons, etc. would pick up a taste for it too...

Has anyone else tried downloading Dale Heatherington's new release of
APRSD?

I seem to be receiving CRC errors upon trying to uncompress the archive.

Sounds like what you are suggesting is to make each letter of the alphabet
have a different number of bits. Then all the bits would be "stuffed
together" to make one long string of bits, which would then be chopped into
8 bit bytes. Those 8 bit bytes would then be transmitted in the data
portion of ax.25. The problem with this, if I'm right so far, is that some
of those 8bit bytes would be non-printable ascii characters. Like MIC-e
packets they would get clobbered in the internet system.

But I like this idea alot... just can't figure out how to make it work.

Wes

Subject: [aprsspec] Varicoded Message, Bulletin, Announce Proposal

Let me flesh out my idea a bit further. I am proposing a new
Message/Bulletin/Announcement Data Type Identifier - let's say "\" to
indicate
Varicoded Messages, etc. The max. size is still 67 bytes, so more characters
would generally be available for messages given the usual distribution of
characters in message text. I suggest the use of G3PLZ's varicode alphabet,
which
would be interpreted by enabled APRS clients just like ASCII, since lookup
tables
are used for either ASCII or a Varicode to translate binary strings into
text.
The legacy message type, indicated by a DTI of ":" would remain in use to
permit
messaging to older client types. As a matter of convention, NOT
specification,
Bulletins and Announcements should not be Varicoded until Varicode-enabled
APRS
clients are the norm. G3PLZ's Varicode alphabet seems like a good fit
because it
was developed from character frequencies in English, not QSOs. Much of what
is
passed in a QSO is already encoded elsewhere in an APRS packet - e.g.,
callsigns,
QTH, WX, etc. Varicoding messages could enhace the tactical utility of APRS
by
permitting longer free-form messages within single packets, which would help
prevent channel congestio

Well, not the cat that chewed the wires, but my golden retriever loved
jalapenos... Had some out for snacks on small squares of cheddar with
a sprig of pickled garlic. Dog got at them. Loved them. Loved even
the peppers after that.

But then, the dog also loved bees. He would go after the yellow jackets
till his mouth was swollen...

If I shot the rabbits around my ham shack with a firearm, I'd get a visit from the local police right quick.   They frown on that inside city limits. ;)   I do have a laser sighted and scoped 10/22, though.

We do have a pellet rifle which works OK, but the little varmints multiply...well...like rabbits...

Occassionaly the Pugs (Abbie and Trav) will catch a rabbit and use it for a good game of tug-o-lagomorph, but the dogs are too slow to get them all.   Plus they only have free run of the back yard when someone is home.

One of these days I gotta fix the wires on the SXFL Digi WX station...and get it hooked up...   Another radio project...

Did you ever look into how quiet a 22 Short is from your 10/22? Or even a 22CB?

Or, if you have a 'gas operated' 22... Like an AR-15 with a 22 conversion kit? Just shoot almost ANY sub-sonic 22 in it and you can hear the metallic 'clank' of the hammer/firing-pin, and the 'swot' of the bullet hitting the target. And not hear much else...

Rabbits cause millions of dollars of damage to public and private property
every year in the U.S.   They carry diseases like bubonic plague and Lyme
Disease; and are routinely infested with fleas, ticks, and tapeworms, which
they transmit to houshold pets.   It has been well noted here, that they
damage communications networks, by chewing wires.   They are varmints, in
the true sense.

Since their natural predators, like coyotes, fishers, mountain lions, and
snakes have been seriously reduced in numbers, and are almost non-exitant

in urban and sub-urban areas there is nothing to check their
numbers. Homeowners and ham radio operators alike, need to protect their
property and indeed their lives, from rodent infestation.

Unfortunately, we have people like Mr. Berg and Mr. Bendall, who have the
misguided belief that fwuffy bunnies are too cute to kill. Or that catch
and release is an honest answer. Wild rabbits are a bio-hazard (any hunter
knows why there's a rabbit season). To live-trap and transport large
quantites of wild rabbits is a serious and expensive matter, plus you'll
probably be dumping your problem on someone else.

Are there solutions other than local control? Yes, currently some very
bright people are working on ways of applying a mixture of Permethrin and
Pyriproxifen to rodentia in the wild, with some good success. But is
expensive and takes 2 years or more to achieve any measurable level of flea
& tick reduction. And it doesn't kill internal parasites, nor does it
stop a lagomorph's incessant gnawing. It's the gnawing that kills trees,
vines, and other plants, and ruins wires.

As for eating rabbits, well I believe Jack London noted something in one of
his novels about starving by eating rabbits. Very little meat, and they're
too lean... ;)

I merely brought up the subject because my own WX station was rendered
non-functional by these little nippers. I take no joy in killing
them. But they are a pest, in the very true sense of the word, so kill
them I will. I'm sorry that upsets you...

73,

Mark
KC7BXS

The bounty on rabbits is only 2 cents, because they are harmless and lovable...

Listen and Read carefully,

I breed and raise rabbits, I understand far better then you do the
perils and pitfalls of the species. I have been doing it for 15
years, I am also a responsible Hunter and Firearm owner.

I do not object to Hunting, I do object to a
person who chooses to give

advice advocating the discharge of firearms
without knowing the persons living arrangements
especially in a residential area.

As I stated before, many places do not permit
the discharge of firearms, pellet guns, longbows and
crossbows.

I have said my piece, I will post no more on this topic.

```
In the immortal words of Elmer Fudd....

"Kill da wabbit.  Kill da wabbit!  Kill da WABbit!!!"  (sung to "Ride of
the Valkyries" by Wagner)

Bugs:  "Oh MIGHty warrior of such fighting stock.... <munch> <munch>
       "Might I inquire to ask <munch munch munch 'What's up Doc?"

Elmer: "I'm going to kill da wabbit, kill da wabbit!"

Bugs:  "Oh MIGHty hunter it will be quite a task.....
       "How WILL you do it, might I inqui-yur to AHSK?"

Elmer: "I will kill him with my speayuw n magic HEWWmut!"

Bugs:  "Spear and magic HELmit?"

Elmer:  "My speayuw n magic HEWWmut!!!!"

Bugs: (pointing over shoulder cockily) <spoken> "Magic helmet...."

Elmer:  "YES! and I'uh give you a SAMpuwuh!!!!"

(the preceeding from "What's Opera, Doc", (c) Warner Brothers, 1959.)

Well Said:

In the US; ANYWHERE within " City Limits " it is ILLEGAL
to " Discharge " a firearm....makes sense to ME....

By the way; what's the Hunting Seasons up there
like now-a-days ?

As we of " South of the Border " understand,
you can't even go up your way to Hunt any more?
If you try to cross the border with firearms now, you'll
be ARRESTED ?

(not that I'm a hunter; but I am INTERESTED
in the " politics " of the day)

As in New Jersey.   How do you guys string antennas for field day?

http://www.antennex.com/hws/ws0502/seall.html

 From the Daisy Powerline (TM) slingshot page:

"State laws prohibit us from shipping or selling slingshots to residents of
Illinois, New Jersey, Connecticut, Delaware, New York, New Mexico and
Washington, D.C."

Sheesh!   Dennis the Menace wanted in 6 states and DC for possesing a piece
of wood and a rubber band...

Now all those states in the Eastern Bloc I can understand, but New Mexico?

I have an Arrow T-59 staple gun, is that next?  Will the public posession
of insulated staples be a crime?

73,

Mark

Many cables are treated with chemicals that animals do not like.  The cables
that are not treated are usually chewed up!
At one of my locations, we have Donkey's (Desert Mules) that love kicking
the shixxx out of any cable they can find....and I think they team up and go
looking for it!

And then you need to buy a computer to interface to a TNC/Radio.  And in a
remote application, proves to be very unreliable.  Someday, someone is going
to design and build a pic chip dohicky for the WM-918 allow the WM-918 to
connect directly to a TNC, or eliminate the computer and tnc all together.
```

If that ever happens, the WM-918 would be an excellant way to go for a
remote WX station.

> an error of around +/- .03-.06 inches.

In many cases precision of accuracy is not what is important. Accuracy is
in the eyes of the beholder. Repeatability is what is most important. An
instrument can be off, way of, and as long as that is understood, makes no
difference. A trained Instruments tech will understand this. However, if
an instrument does not repeat its measurements, then it can not be relied
on. Example: Your gas gauge can be off 5 gallons. As long as you know
this, you are ok. Most people can mentally adjust for a repeatable error.
However, if it is off 5 gallons one time, 3 gallons the next, 8 gallons the
next, you will probably 'not' be ok.
Another perfect example of this is the difference between true north and
magnetic north in the Arizona Deserts using a magnetic compass!

Actually, not true. For example, here in Mass the 'unlawful discharge
of a firearm' is how I believe it is worded. And there are rules and
considerations for what constitutes an 'unlawful discharge'. But there
is no blanket ruling on that.

> By the way; what's the Hunting Seasons up there

Up until the rewrite of the local gun laws a couple of years ago,
slingshots were a 'prohibited weapon'. I could own a machine gun,
but not a slingshot.

The rewrite seems to have let the slingshots slip out of the law. But
I don't know that for sure yet.

I only mention that because a lot of HAMs use them for launching
antennas, especially for field days or other temporary setups, and
we had to go out of state to buy them. And risk a gun law violation
for even having one...

Actually, I would venture to say MOST of this thread has 'moved off'
to private discussions.

Isn't that a real positive aspect of HAM radio? Various topics come up
in discussions between HAMs, and friends are made with like interests.

Seems like a plus to me.

Only now there will be people objecting to it. And that's ok too. Except
for the fact that I will lay long odds the thread will be dead or almost
dead, and someone will just have to 'chime in' with a complaint to get
the last word in. Maybe even a day or two after the thread originally
dies. It almost always happens....

Curious if any of you have tried the USB to Serial adapters?
Do they work well in TNC applications or is it another gimmick that comes
close to the real thing, but fall short when it gets down to the
nitty-gritty?

I expect that they'll work fine for hardware TNCs and software that is nicely
behaved and uses the OS services to talk to the com ports. they probably
won't work at all with Baycom style TNCs that rely on software to implement
synchronous serial comm.

I use one (a Belkin) with an iMac; OS 9

There is no other way to get into the computer,
so it's either that or nothing (APRS).

It works quite well/just fine, EXCEPT:
I now purchased a Belkin HUB, and it will
NOT function properly with a camera and printer
plugged into it.
The signal will NOT go through the HUB properly, and
get to the computer....anyone have any idea WHY NOT ?
Both units were purchased from the counterpart to the site
you listed.

Well, first off, consider how these things work.

USB is a serial bus that interfaces to a special chip, usually on the PCI
bus,
in a PC. When a device is recognized as being active on the USB bus, the
host software makes it 'appear as if' that device is on the host bus.

Now, how does it do this? There are no interrupts on USB, but it supports
devices that obviously need and use interrupts. USB had no 'ports' that
you can 'talk to' kind of thing.

The host in this case 'virtualizes' what it needs. For example, if you
put a
'serial' device on USB, the host will 'create' a serial port for that
device.
Accesses by the host CPU to any address for that serial device are trapped
and sent 'as if' the CPU was talking to a real serial port. In addition,
the
USB device at the other end sends data and status back that the host USB
support also 'converts' so that the CPU (from a user point of view) cannot
tell is not from a real serial port installed in the machine.

This means that if have software that talks to a serial port on a DOS
machine, even to the point of running interrupts, the USB support should
'convert' that so that it interfaces to a USB devices and cannot tell that
in this case the serial device is at the end of a USB cable.

Think of it like your phone. For years phones worked by being a current
modulated loop. You talked, you modulated a current loop, the other
party heard you. Now there's a CPU in the way, converting it to digital,
maybe optic, maybe microwave (there's still a bit of that!) and back to
a current loop at the other end. Can you phone tell what happens to the
signal in the middle? Does it matter?

The trick is at what level the USB support works, or doesn't work. And
at what level the application tries to know what's going on. If you run a
DOS application, it probably only knows about the 'hardware'. So IF
you get a USB setup that happens to make the device appear just as the
hardware the DOS application expects, then it should work fine.

But, with most PCs coming with multiple serial ports, the USB stuff is
usually 'tacked on' to a long list, moving outside the venue of what the
DOS application knows how to talk to.

In this case, if your application is newer than the DOS application and
knows how to talk to windows COM ports, then again it will probably
work. But it's a big if...

Where MOST of the problems lie, in my opinion, is that a LOT of the
so-called windows applications are no such thing. They are a partial
kludge just to make a minimal set of functionality 'appear' to work, and
generally only work on a few of the com ports that it the programs still
try to force as if they were real hardware available.

Mike

Having read all those good points, I will toss this out:

1. Win2k Pro, APRS+2.06, or YK. TNC works fine as USB derived com4; gps on
usb derived com3. Machine has "real" com1 (db9, used for hotsync a Palm)
and com2 (built in modem with uart)

2. Garmin's windows "PCX45" management software is more a dos program with
a kludgy gui. Does not work using the usb com port.

3. Of course the Baycom mostly-software (DOS) tnc gadget does not work wtih
the USB.

I NORMALLY delete these long threads... I mean, just how interesting (TO ME)
is the ISS, GATES, and all the other stuff that goes on for weeks... but
this thread has actually been FUNNY... and since I too have the critters
living in the no-mans-land buffer between me and the interstate highway
behind me, I have RABBITS, DEER, DUCKS, GEESE {could possiblly tie the award
for most obnoxious animal on earth}... and the yard is fenced... but the
RABBITS sit outside the fence and taunt the dogs. The only thing that scares
the rabbits is an unidentified flying object. They do not immediately know
if it is an inbound Mallard or a hawk on war patrol.

I keep a .22 Remington bolt action with a 4 - 9x scope. The old Remington is
a single shot -- perfect for night sniping of cable jacket offenders.

Well, back to reading... somebody ought to archive this stuff and publish it
at the Hamvention or the DCC.

Bob

Since I have a laptop with ONLY 2 USB's and no serial, I was forced to go the USB >> Serial adapter way. So far the only adapter that I haave used that worls well is the one sold by http://www.pfranc.com (same guy with Garmin connectors). It works with MOST things, TNCs and GPS's just fine, but I find some un-self-powered devices have problems.

As in New Jersey.   How do you guys string antennas for field day?

http://www.antennex.com/hws/ws0502/seall.html

From the Daisy Powerline (TM) slingshot page:

"State laws prohibit us from shipping or selling slingshots to residents of Illinois, New Jersey, Connecticut, Delaware, New York, New Mexico and Washington, D.C."

Sheesh!   Dennis the Menace wanted in 6 states and DC for possesing a piece of wood and a rubber band...

Now all those states in the Eastern Bloc I can understand, but New Mexico?

I have an Arrow T-59 staple gun, is that next? Will the public posession of insulated staples be a crime?

Rotten luck. Got my 1/4 wave moved to a 2ftx2ft sheet of aluminum and mounted on the top of my metal chimney just in time for the last pass today. Unfortunately despite what the nasa foot print says I was apparently too far out of the line. I could hear the squelch break a few times on another radio but no discernible packets.

Is anybody actually gating or seeing aprs packets over the central US on these passes. I am seeing some qty of interactions of stations with a bbs but have yet to see a single aprs packet on the passes I have made sure and been at a terminal where i could see the data.

I am beginning to suspect that the tnc I have allocated for the Igate may have problems. It is a paccom micropower 2 and it was not printing most packets I was hearing even though they acoustically sounded reasonable. I am going to try and swap TNC's between my 144.39 and Igate radios and see if that makes a diff tonight. The other tnc is an mfj1270. At least if the paccom has problems it will be easier to debug it on 144.39 than the <10 minute passes on ISS.

>
>Ok, I'm looking for an inexpensive weather station

A couple of thoughts here. The Peet model 100 is the lowest cost Peet station with serial output. It doesn't have humidity and pressure, but rain, temps etc. West Marine sells the Peet 100 as a "weatherbase 10" unit. Check their website www.westmarine.com. I got one of the Wx base 10 on sale a few years ago for about 140 bucks. Also picked up a Peet 100 for about this same amount.
The Weatherbase 10 is shown at http://www.theworks.com/~wa6ylb/wa6ylb4.htm

> Also, anyone have any idea of how to
>build, or know of where I could buy, a wave height indicator?

If you do come up with a sensor, then you might consider a KPC3+ tnc at the site, since you can interface into the A/D sensors in this tnc, and beacon the telemetry.

I picked up a Belkin product using, I believe, the Magic Chips chipset for USB/serial interface. Sold for $49 for syncing a PDA. I attached it to my Linux system, and it just worked, no modules to load, no problems. Oh... it did come with a drivers disk for Windoze, but I didn't use it in the CD drive, as I needed a coaster at that point...

But really: At least in the Linux box, it was detected, and just worked. It worked with a TNC, and with several other devices, at a number of different settings, including data rate and flow control. And behaved appropriately.

I'd fully expect it to work with Windoze at least as well, since I'm sure that was really the target OS.

I'm using mostly the belkin PDA adaptors.

The biggest problem I have hit with them, is that if you use them on multiple systems, you never know what port number they will pop up as. It can take quite a while to sort out which port is which.

I should have mentioned, this is not peculiar to the belkin devices.
All the usb serial ports I have, show this problem, on all my systems.

I do wish there was a switch on the adaptor to set the port number.

Well, I ran into this problem: The BIOS on this notebook supports a HARD Com Port, but this is only functioning when a docking station, which has the com port is attached to the notebook. So when the system boots, it thinks there is a Com 1, but it's really not there. So when I first loaded the driver for my USB/Serial it would come up at Com 2. I wanted Com 1, so I went into the BIOS and disabled the "on-board Com". So now when the system boots up and sees the USB/Serial adapter, it assigns it the first Com IRQ in the list, forcing it to Com 1 (on USB).

You guys are referring to removing the adapter and then putting it on another or even back to the same machine ... correct?

I doubt that this will be a problem as I seldom change the configuration and I have only one box that has USB, but thanks for the heads-up - as sure as I say that I will be instructed that "the 'shack' needs to be in this room" or "don't you think you need to paint in here"

> I do wish there was a switch on the adaptor to set the port number.
>

But the adapter has no way to control this. It's in the BIOS and the USB support.

But I know where you're coming from.

If you can, go into your BIOS and TURN OFF all serial port support

and the USB serial ports SHOULD appear starting as COM1. But
I realize this isn't an option if you need to use on-board serial ports.

The REAL solution is to get software that works with agile com ports
that can appear anywhere. I've seen way too much software that is
really trashy. Oh, the software is great, but the authors just seem to
have no concept of how to talk to serial ports.

Even back in the DOS days, it always seemed that if you could bang
out data and listen on COM1 or 2, that's all they cared about. The
attitude was 'it's your problem' when things didn't work.

Heck, I know of a NUMBER of supposed 'expert' software gurus who
didn't have a clue on how to handle the interrupts off the secondary
interrupt controller.   (Yes, they DO need to be handled slightly
different
than regular interrupts if you expect them to work reliably when
interrupts 'stack up'.) One guy who wrote one of the popular terminal
programs didn't even realize you have to treat IRQ7 (which is IRQ15
on the slave) slightly differently than the rest! What a dip!

Mike

440. [aprssig] Re: REgistering PMAP.OCX in WinAPRS

From: "Richard Brannen" <ka3jca@arrl.net>
Date: Sat, 13 Jul 2002 13:41:43
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89226-2002.07.13-14.20.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have read and looked through the other threads on this topic. I have
been running windows 98 (4.10.1998) with WINAPRS 2.51 and Precision
Mapping
3.5.. The computer has been working great.

Then one day out of the clear blue sky I get the same message

```
LoadLibary("mapocx.ocx")failed
GetLastError returns 0x00000002
```

I have checked the file size and verion, also have checked the registry
with no luck.

Any suggestions would be greatly appreciated.

73, Richard Brannen KA3JCA

I see what you mean, but it's worse than that.
If I take adaptor A, and use it on system 1, it assigns itself to the next
available port. Then I take that one out, and put adaptor B on the system,
and it may go to the next port, or use the same assignment as A did.. It
gets worse with more adaptors and systems.

I know. It is a particularly ugly implementation, but it's been documented since forever. The scary part is that the HD irq is up in that range too.

No. The TNC will look for the first unused call, use it and mark it used (essentially). Since there's nobody around to use K9SOA, it would never get marked unused.

Trackers should only use generic calls. Drop the K9SOA and you should be fine.

I think you meant the right thing, but that description is really confusing.

If the first element in a path is invalid, then nobody (except for a pre-emptive digi (rare)) will digi you.

If the Nth element is invalid, then you'll be digi'd up to that point, then nothing. ie:

relay,wide,Donkey You'll get digi'd on the relay, by any relay, or RWT digi in range, then by any wides that hear them, but nothing after that.

If you used, relay,donkey,wide, then you'll get digi'd by all relays and RWT digis once, but the last wide will never get used because of the invalid middle element. (again, except for preemptive digis)

Try it yourself, and see the results.

I'd go to the DeLorme web site and see if the same adapter is listed
for both.

If not, then at least get the specs for the EarthMate from DeLorme.
I know the TripMate works well at 6v feed. In fact, a lot of people
power it at 5v off laptops at the mini-din for keyboards or mouse.
But while the higher the voltage the better the TripMate seems to
perform, there's a 'toast limit' somewhere just above 8v.

Well, your statement is wrong....there are bunches of V2.6.1 Igates on line.
I know my version of v.2.6.1 is working fine...as far as the igate portion
goes.
HOWEVER - UI-VIEW32 is an AWESOME IGATE program...without a doubt!!!
You can get it at www.ui-view.com

WinAprs 2.6.1 uses the PM 5.0 OCX and mapping data.

> I get the error: "Precision Mapping has not been registered on this

Obtain version 5.0 of the OCX and mapping data.

So what you're saying is:  Spend another 50+ dollars...

Is the "upgrade" to PM 5.0 worth it?   Will it show South Pillsberry Drive
in Sioux Falls, SD?   Will it show Lake Shore Drive in Fallbrook, CA?   Did
they fix the streets that are almost a mile off in Sioux City, Iowa?

Where is the least expensive place to purchase PM 5.0?

I have a copy of APRSPoint on the way.   It'll be intersting to see how it
compares to WinAPRS.

Mark

Interesting.
Mine refuses to pass traffic other than it's own packets, into the system.
IOW, no RF traffic.

Haven't checked outbound yet.

Look at KC6ETE-9 on Findu. It's beaconing every 10 minutes, located about
20' from my putative Igate.  When I fire up -7, it dosen't show up either.
The only traffic from around here making it in, is having to travel almost
all the way across the state to get in, and not making it much of the time.

APRSpoint uses Microsoft MapPoint as it's map database AND display enginer (in a manner similar to APRSplus/Delorme Street Atlas.

BTW, you get three returns on your investment in MapPoint as part of the APRSpoint package. You actually get a full, none-crippled non-CD-keyed version of MapPoint that can be run stand alone as a GPS-moving-map routing application like Street Atlas. It can also be used with the 32-bit version of UI-View to give this normally bit-map map image-based app a fully zoomable, vector-based display

>From what I have seen, MapPoint doesn't seem to use the raw Tiger File database that most of the other US atlas type apps use. Either they have significantly edited/update the Tiger data or their raw source is something else.

 I have noticed significant differences in the position (and even presence or lack of) of numerous roads in MapPoint compared to other mapping systems, I have attached a screen cap of the MapPoint display clearly showing Pillsberry Drive (It really wasn't Pillsbury as I initially assumed it would be!),   to the off-list direct version of this message.

BTW, Pillsberry also shows on Delorme Street Atlas 9.0

It didn't find South Pillsberry Drive, but it did find South Pilsbury Ave
(4100 - 4399 block) in Sioux Falls SD.  It is a short, dead end street that
intersects with East Mission St. Is that the street you were looking for?

> Will it show Lake Shore Drive in Fallbrook, CA?

Dunno about Lake SHORE Drive in Fallbrook, CA but it shows LakeSide Drive
in FallBrook.

> Did they fix the streets that are almost a mile off in Sioux City, Iowa?

No way to tell, but the Census Bureau does request that local
municipalities verify the street mapping data before it is incorporated
into the Official maps.  If Sioux City found any mapping errors in the 2000
Census maps and notified the Census Bureau, the errors should have been
fixed.  Of course, we are dealing with bureaucracies here.

That would be the correct street with an improper spelling.  I guess it is
```

an Avenue. It's a relatively new area of construction. Any farther east
and you'd be in Iowa...or Minnesota.

Most maps (if they have it) incorrectly list all the Lake Shore (two words)
surface streets in Escondido - and the wrong zipcode of 92026. I was
there last month. Got to watch the fire drops out of Ramona Airport up
close and personal as there was a fairly large brush fire just a few
hundred yards from my brother's house. They had a Rockwell OV-10 spotting
and two larger planes swooping in low to drop retardant. Sorry I didn't
have my scanner or HT with me. I guess after that last Fallbrook fire
they aren't taking any chances...

Of course, I flew in to San Diego through Denver and over Arizona so I got
some pretty good views of those fires, too.

Which means they didn't get fixed... ;)

Thanks for the time in looking that info up.

I believe for me it will give 4 returns. I understand that you also get
Pocket Streets with MapPoint 2002, and I have a Pocket PC.

Thanks for the screen cap. It really gives me a feel for the software. I
like the location sensor giving Lat and Lon.

Yes you use Kenwood DC. The TS-2000 is very easy to use this way. You know
that you also have to set Menu 55 to ON and 56 to 9600bps.

Enjoy!

Hi kf4otn,

Yes you can, in a fashion.. John, kb2scs, made available a
program, USWXRADAR, that goes and gets a radar picture of
any area you choose, places it the WinAPRS/images folder.
You then go to the Windows/Images and select that image,
which gives you a radar image of that area, as well as the
aprs stations in that area. This image is updated every so
often automatically, but you must update the image by
selecting /Windows/Images again.. That is the only draw
back, WinAPRS will not automatically reload the image for
us!

```

```
All,
Just recently picked up a Radio Shack 433MHz Wireless Weather Station for
our local EOC. I can't find a model number on it, so I was wondering if it
was compatible with WinAPRS. I know the WX-200 is compatible, but that is a
different weather station. Has anybody sucessfully used one of these weather
stations with WinAPRS?

```
Hi Bill,

Yes.. You can use any of aprs programs to send a message via
the internet, but that program will not permit it to be
gated to the aprs station via RF if it has not been
registered to verify you as an amateur radio operator.
```

You would not have to be connected to the internet to send a
message via RF/APRS IS/RF if you are using a registered aprs
program and on RF. This would be accomplished automatically
as long as your station's path hits an I-Gate..

Good luck, es 73

This question relates to APRS development...

I'm looking for a Pocket PC 2002 application that will make it compatible
with the NET SEND function of Windows 2000/XP.   People using 95/98/ME can
use an App like TrayPopUp.   Is there an application like TrayPopUp for
WinCE or Pocket PC?   I can't seem to find one...

Bandwidth.

If you are running your camera whilst all the others are connected then
things are gonna slow down or stop. I run a USB mouse and a Quickcam Express
on one of my USB chains and once thats going I cannot run anything else. I
can run the mouse, 2 serial adaptors, a memory stick reader and a usb<>scsi
interface without the camera running.

Yes,
It was just tooo tempting to see a like new condition TH-D7AG sitting
there for $225.00. I just could not control myself either when I got my
hands on it....now the fun begins.

It did not come with the manual (on the enhanced feature version). I am
going to the web site and get the main one this morning. Is there a web
site that has settings and other things that can be done with this
thing??? Curious also, I have seen the keyboard attachment that can be
used with the D700. Is there something like this that you could use a
small keyboard for the TH-D7AG?

Thanks,
Robert

Robert,

Good choice! I would have done the same! Hi Hi.

You saw that the Manuals and flyer etc are all available for free download
from the Kenwood site - If you can't get them there, I also have them on the
Shasta County ARES site at http://www.scares.org/guides01.htm .

There is also a specific user group at http://groups.yahoo.com/group/TH-D7/
where there are many experts who would be pleased to help you!

I had been to the same thing as well.

And I was very pleasantly surprised to discover after receiving my TS-2000x
that was a very functional TNC for 1200 and 9600.

Unfortunately, it does not have 300 baud support. And while the DX cluster
support is terrific, the fact that it doesn't support APRS natively like the
D7 and D700's do, that was very disappointing.

Walter/K5WH

Yes you use Kenwood DC. The TS-2000 is very easy to use this way. You know that you also have to set Menu 55 to ON and 56 to 9600bps.

Enjoy!

I am setting up several IBM ValuePoint 486's as Digi_ned digis and I can't figure out the bios access routine. I have been able to access the bios by creating a keyboard fault but this is a pain and not the way I want to do it. Does anyone have the magic key sequence to get into the bios?

The BIOS, sometimes called CMOS, setup utility, or configuration utility,
contains important system and model information pertaining to hardware
settings and other BIOS functions. To view the BIOS perform the following
steps:
1.) Reboot computer using one of three methods:
     A.) Hit ctrl + alt + del keys
     B.) From Windows 95 desktop click on start, shutdown, choose option to
restart computer, and then click on yes.
     C.) Or shutdown computer using power switch or shutdown option from
Windows 95 desktop, wait 30 seconds, and then turn machine back on.
2.) When you see the Blue IBM screen, and memory counting, hit the F1 key to
enter the configuration utility.
3.) Once in the configuration utility, you will see many choices. Use the up
and down arrow keys to highlight what you want and then hit enter. You may
toggle between choices by highlighting what you want to change, again using
the up and down arrow keys, and then using the left and right arrow keys.
Note: the mouse does not function here.

Well, on the pass that just occured (just before 1600z on the 14th), I
didn't hear your station, but a quick check to www.ariss.net indicates that
a good portion of the packets there were gated by you (WD9EKA-15). So, I
guess you solved your tnc problems? I do have one question for you,
though. What APRS software, if any, are you using, and how do you get it
to insert your callsign into the received packet before it is gated to the
internet? I'm running APRS+, and despite following the author's
instructions on how do to this, it still isn't putting my callsign in.

Rendered body type: text/plain

On July 9, 2002, Motorola's GPS Products Group announced (press release)
their planned EOL of its 5 volt and channel Oncore receivers.

http://www.synergy-gps.com/5V_to_3V_Prod_Advisoryp65.pdf

This announcement also contains a launch date of August 2002
for the introduction of a new M12+ Oncore Timing model.

I would expect that this mention in the Motorola press release
may be part of Tom Clark's (W3IWI) upcoming new receiver announcement.

The good news is that a larger number of 8 channel Oncore (VP, GT+ & UT+)
units should be appearing in surplus over the coming year.

Rendered body type: text/plain

Can someone assist me in figuring out this thing?

Sometime ago a friend heard that my KAM got cooked by a lightening anomaly that was way to close for comfort (... only thing that got hit ... go figger) and presented me with a MFJ1270 that had no home. No idea if it works or not just said "If you want it there ya go" (pretty much there was an attachment but we won't go there).

I have 2 cables, the box, and a wallwart to power it. The cables look pretty ruff but appear functional if I can figure out the pinouts, DIP switches, and make the appropriate rig connections ...

must pause a moment I have a Moose of a dog Black Lab/St Bernard Mix and he is here in the floor asleep - flat on his back legs sprawled out everywhere and dreaming - he is "talking" in his sleep and making motions and gestures from all four limbs. Hilarious!!

OK back to reality ... anyhow if someone could assist me to the point of finding out if it at least works I would be highly grateful.

I found a manual online for $50, but I am not up to investing that just to find out if it works.

TIA es 73

Message-ID: <LYR842-89389-2002.07.14-17.25.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Dale Huguley, KG5QD, operates WXSVR which translates the NWS data stream into APRS format (oversimplification, I know).

To gate weather info for your area to RF, set your software to gate the CWA prefix(es) for your area. You can find which CWA prefix(es) you want by going to http://www.ae5pl.net/html/nws_databases.htm and selecting either NWS Counties or NWS Zones.

With my APRS+SA IGate, I have it set to gate all packets with FWD* callsigns (the * means any characters). This means that I am gating all weather messages for the Fort Worth, Texas CWA to RF. You would do the same with US-View, except, of course, using the CWA for your area.

It should be pretty close, but there are some circuit changes between the versions. If it a plain 1270 (or a 1270B), these are closer to what you have than the 1270C manual:

ftp://tapr.org/software_lib/tnc/tncdocs.zip (manuals)
ftp://tapr.org/software_lib/tnc/tnc2sch.pdf (schematics)

Rendered body type: text/plain

Hi All,

Sorry for the off-topic post, but I figured some of you might be experienced with replacing original battery packs for HTs.

I have a Yaesu FT-416 2-meter HT (gray version) and an FT-530, both of which use the same battery packs. I am looking to replace their original NiCd FNB-25 (7.2-volt, 600-mAh) and FNB-27 (12-volt, 900-mAh) packs since they are beginning to lose their charge. I think I will replace them with NiMH packs.

Which after-market battery company (out of many) is the best to deal with, in terms of good product, reliability, and 'fit' (I've heard some after-market packs do not quite physically fit the HT they are meant for)? I have seen MAHA, Sarrio.com, criticalbattery.com, NiCd Lady, and others out there. MAHA is the one I've heard most of, and the rest were found with a search on the 'net.

I'm interested in your experiences and recommendations. Please response **privately.** I appreciate it!

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89418-2002.07.14-20.29.56--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,
I am looking for a way to easily update my keps for APRSData, here is what I would like to do, any suggestions appreciated.

1) Dos network drivers for 3com PCMCIA card (I think I can do this)
2) Share the APRSDOS directory so I can use a Linux box to auto update the nasa.all kep file I use
3) Have APRSDATA automatically check once a day for the new keps and import them.

Anyone done anything with this, or close to it?

Thanks,

Mike

I've had excellent results with Mr. NiCad, also known as E H Yost. They sell batteries, packs, inserts, whatever. And you can get them in various ratings.

I needed a pack for an old u4-AT that the pack just wore out. Called them up. Do you want the standard pack, the high output pack, the higher output pack? They all fit in the existing stock shell. Or they had two even higher rated packs but they had to be 'machined' into the shell. I ordered the biggest mah rating the girl on the phone said would fit into the 'stock' shell without mods. And when it arrived, sure enough, it was a easy drop-in. Well, I really shouldn't say easy. It WAS a very tight fit, but I didn't have to do any 'mods' to get it in there.

I just checked, their web page is at:

http://www.mrnicd-ehyostco.com/

Mike

I've used Mr NiCd for years. Everett shows up at a lot of the shows I
manage to get to.  Always had good results with their products.  I
usually get an entire replacement pack rather than trying to refill, but
that's a judgement call.

I recommend them highly.

If you are responding to my query, I am not trying to uplink, only igate
to internet. I did find a problem. Not sure what is wrong, maybe some
bad coax but I have temporarily moved my satgate radio over to a j-pole
at 40 feet. Seeing lots of aprs and other activity on ISS passes now and
actually found some packets on findu that I had gated.  If I try to use
my 1/4 wave on sheet metal the swr wasnt bad, but virtually no signals
were getting heard. I am going to stay on the J-pole for now even though
the overhead coverage wont be as good it is 100 times better than the
1/4 wave until I can get the cable replaced or the mount. I was getting
enough rf back in the shack when I transmitted on that antenna that it
was resetting my recording a/h meter on my solar panels.

Getting my callsign in was somewhat accidental, though I am glad it is
in there.
Hey Bob Bruninga, is the way my callsign getting in to the path
sufficient for the reports you are  trying to run for it to show up as a
satgate?

Concerning software and how my callsign is getting inserted. I am
running Linux aprsd 2.2.3, I have 2 instances of the program running a
primary which controls my 144.39 Igating and connections to the outside
world hubs and a second instance the wd9eka-15 that is the ISS radio/tnc
and it connects only to my primary wd9eka IGATE via tcp on the local
machine. "fortunately"? via this method it appears to pass along the
callsign of my ISS gate.

   HOpe the above makes sense, been a long day. 6 hours+ of driving
takin g the oldest daughter to a ymca camp.

Say,

Whoever's been putting the wildfires on the APRS IS as objects, thanks!
Great to see.

Is this automatic? (maybe part of the WXSVR?) or is it all being done
manually.

```
I have a Palm M130. I have downloaded the newest PocketAPRS for the Palm.
Now is my biggest problem. I need a cable to interface a AEA PK-88 to the
Palm and I really need to to be able to charge the Palm as I use the TNC.
The exact cable to TNC is not a big must as If I can get a cable with the
end for the Palm M130 already on it I could most likely wire it to my
AEA-PK88 or my Timewave PK-12 myself. If someone has a wiring diagrahm.

thanks for your help in advance,

493. [aprssig] Tropical Cyclone Plots

From: Dale Huguley <dale@wxsvr.com>
Date: Mon, 15 Jul 2002 08:35:04 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89466-2002.07.15-08.18.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hi All-
Hurricane Season is here again in the Atlantic Basin and we have our
first cyclone off the Carolina coast. We also have our usual problem
with old and inaccurate plots.  I don't know why folks will plot an
object- then leave it for 2 or three days sometimes.  If you are not
going to kill or update the object on the next update, don't plot it.
Received at 1200z on the 15th:
;TD-ONE   *150455z3503.00n\07402.00W@15/0300Z - MAX SUSTAINED WINDS 30 KTS
Name is OK - time is plot from 9 hours ago - position is off-
The hurricane center deals in tenths of a degree-
35.3N 74.2W = 3518.00N 07412.00W not 3503.00N 07402.00W
.1 = 06
.2 = 12
.3 = 18
.4 = 24
.5 = 30
.6 = 36
.7 = 42
.8 = 48
.9 = 54
.0 = 00

Any plots of tropical cyclones from Hurricane center data with minutes
not equal to the above are wrong. The predicted position names have an
embedded space- this is not allowed. Also the predicted names are such
as "24HR VT   " which won't work as soon as there are two cyclones. I am
not opposed to people hand plotting hurricanes - I cannot guarantee that
the wxsvr will always be up (I live on a barrier island)- but they need
to be timely and accurate.

I use a palm IIIc for aprs and solved the problem by buying a hot sync cable from Radio Shack (~$16) and modifying it. I cut away the back of the palm connector housing and wired in a pigtail 2.1 mm coaxial connector to pins 9 and 10 on the palm connector (9- ground, 10- +5V). I'm not sure what the pins are for the m-series, but I'd bet you can find them on the web.

I also built a AA charger for the palm that uses a 7805 to provide a regulated 5V from the bank of 5 AA batteries. In-line is a 1A fuse so the palm doesn't draw too much, although all of the charging cicuitry is built into the device.

I did a "same but different" cable, that has the end from a dead USB mouse.
The usb output voltage is 5V.

Those $40 USB charger cables, are two ends and a wire. :)

Hi!
Dick and all!

The project is so new, information is not ready to be released. Some automation is taking place. Information is being sent to the IS and local RF currently and should be seen on all maps on stations connected to the IS....kinda like the QUAKE stuff. However, there will not be a "single" point for collection due to the amount of data and reliability issues with single point systems. The FireNet is broken up into Geographic Responsibility Areas, GRA's.
I am looking for a few volunteers, mainly in California and the north central part of the USA with dedicated, 24 hour/7days a week stations that have an interest in this project. You can see the geographical areas of responsibility for the USA at the following web page...
www.wa6oft.com/FIRENET , as well as some information on the project.

Again, this network is in the beta mode, so-to-speak, and there are some bugs to work out. The teams are growing as more people become interested.
Currently, many of the GRA's are being covered just to get an idea of the magnitude of what "could" be.
It's good data, and compliments what is out there now!

Jim, WA6OFT

498. [aprssig] PCsat comments

From: Bob Bruninga <bruninga@usna.edu>
Date: Mon, 15 Jul 2002 12:05:29 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org
Message-ID: <LYR842-89478-2002.07.15-11.43.54--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For what it is worth, anyone looking at their local APRS RF area maps
might be surprised to see DX stations as far as 2000 miles away pop up
everynow and then... from PCsat.

PCsat is currently relaying most APRS Satellite uplinks back down on both
145.825 AND 144.39. SO anyone whos maps are not cluttered by all the
Internet feeds, might enjoy watching for PCsat DX a few times a day on
their normal terrestrial sytem...

Whenever PCsat resets (it does every 1.6 hours now when it goes into
dark), it crossconnects the transmitters... Thus anyone uplinking on the
normal PCsat uplink of 145.825 will come down on BOTH unless a SYSOP
commands PCsat to isolate the transmitters...

Of course, anyone with special needs can ask for access to the unpublished
uplink to always come down on 144.39. Currently we have one user, on a
railroad car that uplinks so that he comes down on 144.39. Look for
N3IYI...

de WB4APR@amsat.org, Bob

hi all,

on findu.com (ie http://www.findu.com/cgi-bin/find.cgi?call=hr2kos-1) why does this posit beacon :

HR2KOS-1>APZ17:!1530.67NU08806.83W

place the hr2kos-1 digi in africa instead of central america? on rf (ie 2m) the same beacon places the digi correctly on the map. thanks for any info.

HR2KOS-1>APZ17:!1530.67NU08806.83W

It's a combination of things.

First, this is an invalid APRS packet. No symbol defined.

Second, in the absence of a symbol, I suspect FINDU is taking the W as the symbol, leaving no hemisphere marker. Since positive longitudes are East, the icon is in Africa...

The reality of the situation is that FINDU should have rejected this packet.

501. [aprssig] knots/mph

From: Robbie <mwrobertson@attbi.com>
Date: Mon, 15 Jul 2002 12:56:41 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89489-2002.07.15-13.33.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

I think this has been covered a few times but I have a simple question, (I think)..

Whenever I look at raw packets, after the W in the longitude, and see the course and speed, what am I seeing, knots, or mph?

On Findu.com, what is it displaying for speed, knots or mph?

Is this an option in either of the APRS programs and if it
_is_, how would either program know to convert or not to
convert?

Thanks in advance, :-)

Robbie, wa9inf

502. [aprssig] Winaprs 2.6.1 & PM5.0

From: "Koy" <k5koy@lubb.net>
Date: Mon, 15 Jul 2002 12:17:16 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89496-2002.07.15-14.26.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Ok, just got the precision mapping installed and running with winaprs 2.6.1.
Only problem is its not street level when opened by winaprs, but it is stand
alone. Is there some kind of configuration you can do to make winaprs open
it with street level mapping?..HELP!

Koy Carson-K5KOY West Texas.

503. [aprssig] Re: Winaprs 2.6.1 & PM5.0

From: "Spider" <spider@rivcom.net>
Date: Mon, 15 Jul 2002 13:01:26 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89499-2002.07.15-15.40.00--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

check this doc...

Adding C:\PMAPS50\STATES Files

This procedure allows one to place Pmaps on the Harddrive without
the need of the CD being used during operation. This is optional
with the use of UI-View32.
It takes less than 2 minuts to read this note. Please read entire
note BEFORE starting. If you do not understand, STOP!
WARNINGWARNING***WARNING****WARNING***WARNING***WARNING***
Directory can use 571MB of space. Make sure you have the space!
****
****
a. In Precision Mapping Traveler V5.0, click on File.
b. Then, click on Configurations.
c. Then click on the Data tab
d. Verify all your data paths are correct for each folder. For Example;

Data1 Path: C:\PMAP50\DATA1\
Data2 Path: C:\PMAP50\DATA2\
Data3 Path: C:\PMAP50\DATA3\
States Path: C:\PMAP50\STATES\

Pay real close attention to the 'States Path'. This path could still
be set for your CD Drive, such as for example; E:\PMAP50\STATES . If
it is and you DO NOT want to use the Precision Mapping CD, You must
correct the path to your hard drive path as in the examples above.
 READ WARNING ABOVE

e. Close the program.
f. Start Windows Explorer (making sure Pmaps CD is in your CD Drive)
   and click on your CD Drive.
G. Copy the CD Drive PMAPS50\States folder and paste to your hard
   drive PMAPS50\States folder.
   For Example; COPY E:\PMAPS50\States   PASTE C:\PMAPS50\States
   This takes a little while. ***SEE WARNING ABOVE***

h. After completing 'G', close Windows Explorer, remove CD from the
   CD drive and restart Precision Mapping V5.0.
   You should now be able to go all the way to street level without
   the need for the CD being in the CD Drive.

Not sure what you mean by stand alone. However, it seems that WinAprs
2.6.1 no longer saves the PMap last view upon exiting nor does it restore
it upon restart of WinAprs.

> Is there some kind of configuration you can do to make winaprs open
> it with street level mapping?..HELP!

The MapPro50.cfg has two entries that control these settings. LVIEW=FALSE
and LWIND.

Changing LVIEW to TRUE (Enable last view capability) and setting LWIND to
=-82.000000, 43.569024,-80.000000,41.430976 (to cause it to zoom to this
view on start up) had no effect. It seems that WinAprs 261 now ignores
these settings. Add this one to the list.

Rendered body type: text/plain

According to a recent discussion on the Specification SIG, the APRS data extension CSE/SPD is in knots for all packets except full weather reports. In the latter case, the speed (indicating wind speed) is in mph.

These are not option settings.

Rendered body type: text/plain

Does anyone have a mirror site of the winaprs2.61program. The TAPR site only seems to have 2.51 at http://www.tapr.org/tapr/html/gpsf.html. I have tried the Rutgers FTP site several times but it just times out. This is one of the reasons I have been reluctant to bother with WinAPRS. Now I need it to be able to explain to new comers how to set it up. There are those who are impressed by the "Win" label and refuse to even try any other options.

510. [aprssig] Mangled packets on IS

From: Bill Diaz <william.diaz@attbi.com>
Date: Mon, 15 Jul 2002 19:45:40 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89537-2002.07.15-20.24.02--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone have any idea what is causing these packets to be mangled?
Note that M10 is prepended to each call, <UI> or <<UI>> is in every affected packet and the payloads are missing.

Some of the packets appear to be Mic-E packets. I suspect that an IGATE, server or misconfigured TNC is at fault, but cannot yet identify the source.

IMO, since the <UI> construct provides no useful data to the system, it should not be sent to the Internet.

Rendered body type: text/plain

Wow, I got WinAPRS2.61 to run for all of 22 minutes before I got an unhandled exception and it crashed taking down the whole system. This must be a world record for longevity.

Oh well, back to APRS+, at least when it encounters a problem it generates a bug report that allows me to copy the error message into an Email and send it to Brent who then typically replies in less than 24 hours with a fix or suggestion.

I guess this makes APRS+ errors "handled exceptions". Oh and all I have to do when I get one is close the offending window without stopping the program. APRS+ is what you get when you cross a Timex watch with the Energizer bunny and embed the resulting offspring in software. A program that takes a licking and just runs and runs and runs.

I just received my registered copy of APRSPoint today in the mail. It looks like a very good start for a program. The only problem I seem to encounter is that it doesn't like to stay connected to APRS servers.

73,

Mark

Just a guess, but maybe its a multi port tnc with the channel prepended to the actual data. I dont recognize it as an AEA format but I know my pk-900 does prepend several bytes to each packet going to the terminal so the software can determine which port and which lcn(I think that is the abbr., been awhile the logical channel maybe it is lvc).

515. [aprssig] Re: Mangled packets on IS

From: "AE5PL Lists" <HamLists@ametx.com>
Date: Mon, 15 Jul 2002 22:16:10 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89546-2002.07.15-22.54.35--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

May be, but if it is, there should be a separator between the port # and the callsign (like a space, for instance). Otherwise, there is no way for these "M10 callsigns" to be recognized as invalid (all the ones shown are 9 characters or less).

WinAPRS had (don't know about 2.6.1) a problem with <UI>'s in the line. I agree with Bill: everyone should make sure that their TNC's are configured to not display <UI>'s, connected packets, RR packets, etc. The reason <UI>'s in the header are meaningless is because the only packet types that are to be put on to APRS-IS are UI frames.

Most client software packages and IGates do not handle improperly formatted lines well. If the TNC is not in KISS mode, the TNC should be configured to only show the header followed by the packet payload separated by a colon on a single line. Port numbers can be included, either prepended to the header with a separator such as a space or appended to the header with a separator such as a /.

516. [aprssig] RE: Winaprs 2.6.1

From: "Herb Gerhardt" <hgerhardt@charter.net>
Date: Mon, 15 Jul 2002 20:21:46 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: "nwaprssig" <nwaprssig@nwaprs.org>
Message-ID: <LYR842-89547-2002.07.15-23.00.16--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I loaded WinAPRS Version 2.6.1 on my laptop upgrading from Version 2.5.1 as soon as it came out and have not had a single crash of Version 2.6.1! I am running it on my Toshiba Satellite Laptop which has a 30 Gig HD and Win XP Home Edition as its OS.

I do not suspect that it is the fault of the WinAPRS program. I suspect that it is a memory conflict of some sort on your computer with WinAPRS. When I was running all previous versions of WinAPRS on my old computers, I always had routine crashes. I found that Win95 was somewhat stable. Win98 Version 1 was very unstable and caused crashes about every 2 hours. Win Me was much more stable than 98 but still caused occasional crashes. I am impressed with Win XP compatibility with WinAPRS. Like I said, I have not experienced any crashes yet. In the past when I did experience excessive crashes, I gathered as much info as I could on the conditions and emailed them to the Sproul's for info.

I have been reading a number of complaints on WinAPRS lately. Folks you need to remember that all of the authors of the various versions have a "real life" outside of Ham Radio and APRS. At least, I hope they do. This is a hobby for them and not all of them can devote as much of their free time as others can to devote in fixing and upgrading their particular version of APRS. Don't get me wrong, I too look forward to updates to WinAPRS which I have run and promoted in our area for years. Yes, WinAPRS Version 2.6.1 has some problems that I am not happy with (the main one is that the PM 5 maps can not been displayed as full screen) and have experienced some of the problems we have all encountered with this version, but I can wait. I have patience, it comes with age! Hi, hi. I am sure that the Sproul's are working on the various problems that we have notified them about, but they do need some time to work out the bugs and correct them.

Lets all feed the authors the info of the problems you encounter with their program. They do pay attention to the inputs they receive, but please don't expect them to stop their personal lives to resolve the problems encountered in our hobby.

By the way, my favorite "mirror site" for all versions of APRS is:
http://www.tawg.org/

It is the easiest site that I have found for maneuvering around and finding the download you are looking for.

Remember the most important thing in APRS is: WE MUST HAVE FUN! So, let's all sit back and enjoy our hobby.

517. [aprssig] Repeater Callsigns in Canada

From: Adi Linden <adil@adis.on.ca>
Date: Mon, 15 Jul 2002 23:48:38 -0500 (CDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89558-2002.07.16-00.27.02--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

I am wondering about the proper way to identify a digipeater. When I first got involved with packet radio I remember it being just fine to identify multiple digital stations using a -1, -2, -3, etc suffix to the callsign. So if my pbbs mailbox at home was va3adi-1, my vehicle could be va3adi-2 and my ht va3adi-3, etc. Is the same true for aprs? Reading some of the aprs documentation, it seems like specific suffixes are associated with specific thinks like vehicles, etc.

Further, I have a callsign for my irlp node, va3slt, and the same location will also be an igate and digipeater with callsign va3slt. I am thinking about dedicating another tnc to a satgate. Would it be appropriate to give the satgate the same callsign or should there be a suffix?

Because my home has poor wide area coverage, I hope to build a digipeater that will be located on a nearby hill. Would I be able to use the same callsign with suffix, like va3slt-2, for it?

I would just like to get an idea about the appropriate use of those suffixes for aprs. It's been a while since I've been active on packet and the Industry Canada rules don't seem to say much about callsigns and packet.

RD> what is the symbol for a uidigi digi? i thought it was the U.

The _symbol_ is the # character after the longitude. The U is the
overlay character, that goes over the star generated by the #.

All of this is covered in the APRS/DOS documentation, but spread out
across a few files. And, of course, the ones I have on my web site are
a bit out of date, since DIGIS.TXT from version 8.44 does not contain
the new overlay characters...

Hi,

I am looking at building a digipeater but don't have a spare tnc. Are
there any performance issues to keep in mind using Baycom style hardware
and Linux? I have a spare embedded board with a 486 133MHz CPU I'd like to
use with embedded Linux and aprsd or digined. Any thoughts on that
combination?

Thanks,
Adi

So what did you do for the ISS radio/tnc aprsd instance? Did you disable
all the ports except for the one talking to the igate aprsd or specify
different port numbers?

Rendered body type: text/plain

Leadtek seems to make the smallest CF GPS, I've seen. Problem is I never
seen one for sale, nor can I find much baout them on the Web.

http://www.leadtek.com.tw/www/Web_Leadtek/gps/9534.asp

Supposedly Destinator is supposed to be their US sales outlet, but I see no
mention of that on their site.

http://www.destinator1.com/products.emb

Anybody have any info on Leadtek CF GPS units?

I specified different port numbers for the second instance. I am in the
process of rolling back the ISS instance to aprsd 2.1.5 though, I had
bumped it up to 2.2.3 and my callsign was no longer showing up in the
gated packets. I'll see on the next pass if it was the upgrade that
caused it.

526. [aprssig] PCsat sets NODIGI

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 16 Jul 2002 13:20:13 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89658-2002.07.16-12.58.50--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat users:

We just turned DIGI OFF and all 1200 baud TLM off.

Although PCsat has been perfectly usable in the afternoons into early evenings, we are still running the batteries down on every eclipse.
So today I thought of one last low power mode I can try so we turned DIGI and TELEMETRY OFF to see if we can make it through just ONE eclipse.
Thats all we would need to recover PCsat back into positive power budget.

I will try this for the daytime passes over the USA this week (which will effect the evening passes over Europe)...

The lowest power mode of PCsat has been with all BULLETINS and all DIGIpeating turned off. Also we disable 9600 baud 1 minute telemetry as well.   THus the only thing remaining was the once per minute single 1200 baud telemetry packet which is required to keep the heart-beat fail-safe reset timer tickled. Whats new, is that we realized that if we switched the 1/min TLM to 9600 baud instead of 1200, we would further reduce the minimum transmit duty cycle in our lowest power mode. Thus halving our transmit current drain.

Unfortunately, our TRANSMIT power is already less than 10% of the overall bus power, so this move will only gain us about 5%, but worth trying...
Our minimum transmit average current drain (1 packet per minute) is only about 16 ma out of the nominal 160 ma low power mode. Droping this in half saves us about 8 ma. Who knows, maybe it is the straw that can give new life to the camel?

Anyway, when PCsat is in this minimum mode, the ONLY thing you will hear will be a once a minute half second noise burst... (9600 bd TLM)...
nothing else.

Sorry for the inconvenience. If you were planning a PCsat demo this week, let us know and we will turn it back on.

What is the procedure for sending out "test" emergency packets? For instance,
I want to configure one of the PMs in my Kenwood D700 for Emergency with a
high beacon rate. However, to make sure that this works, I will end up sending
some emergency packets. How do I ensure that all recipients understand that
these are test messages only? I can place a message in the packet, send a
message to all, send a message over the APRSSig, etc. Any suggestions?

Thanks,

Terry

Switch frequencies on the D700 and take another station with you.
Test there, then turn off the emergency beacons and move back to
144.39.

>

Help me interpret your log as I don't have or run UI-View...

I am guessing this is a transmit log. If I am correct in this guess,
then it means the following two packets were transmitted by your
station:

```
KC6ETE-1>APU24R,WIDE3-3:}W9IF>APRS,TCPIP,KC6ETE-1*:;141726q42*141726z241
7.40N\12507.20 EQMag 4.2 Depth 32.9 km SW RYUKYU ISL., JAPAN
```

and

```
KC6ETE-1>APU24R,WIDE3-3:}W9IF>APRS,TCPIP,KC6ETE-1*:;141726q42*141726z241
7.40N\12507.20 EQMag 4.2 Depth 32.9 km SW RYUKYU ISL., JAPAN
```

It appears that the dupe is occurring due to the first packet having a
trailing tab and the second one not having any. Having just run an
APRS-IS trace, I found the following:

```
!T 19:00:19 !W9IF>APRS:;151957q45*151957z3155.20N\13136.60EQMag 4.5
Depth 33.0 km KYUSHU, JAPAN
!T 19:00:20
!W9IF>APRS,TCPIP,KB7ZVA-1*:;151957q45*151957z3155.20N\13136.60EQMag 4.5
Depth 33.0 km KYUSHU, JAPAN
```

The first is generated by W9IF. It includes the trailing tab. The
second is apparently being gated back to APRS-IS (it shouldn't be since
it has TCPIP in the header). Somewhere between the origination and when
the packet gets gated back to APRS-IS, the trailing tab is being
stripped.

I will make a modification to javAPRSSrvr to exclude trailing tabs in
the dupe check algorithm to help keep this from appearing on APRS-IS.
However, whoever is gating the 3rd party packet from KB7ZVA-1 back onto
APRS-IS needs to get their software fixed.

When using rotate.aprs.net from a Windows machine, you can determine
what system you are connected to by running the netstat -n command.
Look for a connection to the same port (probably 23) that you used in
your APRS application setup.

Ok, so they are logical dupes, but not literal dupes.

>The first is generated by W9IF. It includes the trailing tab. The

I've tweaked the system here, to connect only to first, second, or third
(no more rotate) on 10152, as described in
http://www.jnos.org/cgi-bin/moin.cgi/APRS_20Server

Rendered body type: text/plain

I was in Best Buy today and noticed they had the Toshiba e740 on sale for
$540.00.   This is an incredible price for any upper level Pocket
PC.   Especially when the e740 has an X-scale processor and BUILT-IN
802.11b. I paid slightly less for my Casio E-200 and an SMC CF 802.11b CF
card together, but I lose my CF slot in the process...

http://www.bestbuy.com/Detail.asp?m=488&cat=526&scat=527&e=11161521

And I believe they are offering free shipping...

amazon.com is matching Best Buy's price, BTW.

A very good review on the Toshiba e740:

http://reviews.pocketnow.com/content.cgi?db=reviews&id=260

It's not a perfect Pocket PC, as the review points out, but the price is
decent (comparatively).

I have played a little with VoIP with my Pocket PC and have found that
Ruksun's Messenger Voice is a decent app that works in conjunction with MSN
Messenger.

http://www.ruksun.com/mobile_computing/windowsce/products/voice_messengerforce/

The best app I have found in clarity and least latency is Gtony's Pocket
G-Phone.

http://www.gtony.com/pocketgphone/

As usual, I work for none of the companies mentioned in this post...

Rendered body type: text/plain

I am trying to setup a weather station in stand-alone mode. I would like it to communicate with another TNC that is hooked up to APRS. But nothing will transmit through the TNC that my weather station is hooked up to. I am assuming that my TNC is not configured correctly. Since I am new to amateur radio, I do not understand all the commands of the TNC. Could somebody give me their configuration of their TNC if it is a KPC-3 Plus and you are using it with a Peet Bros. Ultimeter 2000. Also, I am not using it with a GPS unit. Thanks.

533. [aprssig] Radio Felonies?

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 16 Jul 2002 19:58:49 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89695-2002.07.16-19.37.17--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I hope I am not forwarding an unverified report, but I just saw this new law that really makes listening to just about anything not intended for you not just illegal, but now a Federal FELONY.

forwarded clipped email---

... these legal changes... [make]... any use of radio to intercept a radio transmission not "readily accessible to the general public" under 18 USC 2510 and 2511 even for hobby curiosity or testing purposes may well have just become a federal felony with 5 years in jail as a penalty and no safe harbor for hobby activities or a first offense.

Prior to the passage of this bill intentional hobby type interceptions of radio communications that weren't "scrambled or encrypted or transmitted using modulation techniques the essential parameters of which have been withheld from the public with the intention of preserving the privacy of such communications" were treated either as a misdemeanor offense with fines or a year or less penalty or for interceptions of cell calls, pagers, and cordless phones and phone patches on trunked systems as an "offense" for which the maximum penalty was a $500 fine.

-------- posting follows --------

The House just passed the Cyber Electronic Security Act last night (7/15/02) by an overwhelming margin of 385-3.

Buried in an otherwise draconian bill that raises penalties for computer hacking that causes death or serious injury to life in prison and allows government monitoring of communications and email without warrants in even more circumstances is the following seeming obscure language:

> SEC. 108. PROTECTING PRIVACY.
>
> (a) Section 2511- Section 2511(4) of title 18, United States Code, is amended--
>
> (1) by striking paragraph (b); and
>
> [For those of you who don't realize what this means ....]

What this does is change the penalty for the first offense of intercepting an unscrambled and unencrypted radio communication that is not supposed to be listened to (eg AMPS cellular calls, commercial pagers, cordless phones, common carrier communications) for hobby purposes (eg not a tortuous or illegal purpose or for direct or indirect commercial advantage or private commercial gain) from a misdemeanor (one year or less prison time) to a federal FELONY (5 years prison time).

And further this changes the status of the specific offense of listening to a cell call, cordless call, a pager, or a public land mobile radio service communication (eg a telephone interconnect) from a minor offense for which one can be fined a maximum of $500 to a federal FELONY for which one can be imprisoned for up to 5 years.

In effect this removes a safe harbor created during the negotiations over the ECPA back in 1985-86 which ensured that first offenses for hobby radio listening were only treated as minor crimes - after this law is passed simply intentionally tuning a common scanner to the (non-blocked) cordless phone frequencies could be prosecuted as a felony for which one could serve 5 years in jail.

And in case any of my readers have forgotten, a federal felony conviction (even without any jail time) deprives one of the right to vote, to own firearms, to be employed in a number of high level jobs and professions, to hold certain professional licenses and permits, and important for certain readers of these lists absolutely eliminates for life the possibility of holding any kind of security clearance whatever (a recent change in the rules) - something required for many if not most interesting government and government related jobs.

So merely being stopped by a cop with the cordless phone frequencies in your scanner could conceivably result in life long loss of important rights and privileges.

The careful, thoughtful reader will note that section 4 has been revised a bit lately, and that this new section 4 (see above) now makes it a federal felony with 5 years in jail penalties to violate section 1 INCLUDING the following provisions of section 1:

18 USC 2511:

> (1) Except as otherwise specifically provided in this chapter any person who - intentionally discloses, or endeavors to disclose, to any other person the contents of any wire, oral, or electronic communication, knowing or having reason to know that the information was obtained through the interception of a wire, oral, or electronic communication in violation of this subsection;
>
> OR intentionally uses, or endeavors to use, the contents of any wire,
> oral,
> or electronic communication, knowing or having reason to know that the information was obtained through the interception of a wire, oral, or electronic communication in violation of this subsection; or
>
> shall be punished as provided in subsection (4) or shall be subject to suit as provided in subsection (5).

This seems to have changed the status of revealing as part of a hobby list any hint of the contents of a radio communications that might or might not have been legally intercepted from a potentially minor misdemeanor offense or less to a serious felony. Thus if a court finds that any communication reported on an Internet list was not legally intercepted, felony penalties apply for publishing the information even if the interception was for hobby purposes (which of course most scanner list intercepts are).

Thus the legal climate has fundamentally changed, and one can assume that since the Bush administration has been pushing for the passage of this bill that they perhaps intend to start prosecuting at

least some category of radio under the new provisions - no
doubt as an example meant to scare the rest of us into handing our
radios in at the nearest police station...

So yet another blow to the radio hobbies.... and a big one
indeed...

Rendered body type: text/plain

Hello all,
I received the following from another station here in Colorado and I have no idea as to why she is having this problem. I also run v2.6.1 and have no problem tracking my D700. Any ideas are appreciated.

I am running a Kenwood TH-D7 for my mobile rig. Beside my own aprs
display showing up back east I also see
every Colorado Front range unit using mic enc format displayed back
east. I am running my winaprs on a Pentium 120 using windows 95. It
does not seem to make a difference weather I run version 2.4.6 or 2.5.1
in winaprs. If I use aprs+sa it displays just fine.

Tnx & 73,
Dave N0EOP

Well, it's not a law yet. The house passed the bill, but the senate has to ratify an indentical one, too, before it can be passed to the President to sign it into law (or veto).

But it goes to show that no one's freedom is safe when Congress is in session.   The law is almost moot, anyway, since more and more wireless transmissions are going to some kind of digital modulation - although despite what your hear from the cell phone companies - 70 percent of all cell phone traffic in the US is still good ol' 800 MHz analog. But that too will change.

CESA will probably pass the Senate in some form or another...but provisions of it will probably be taken down on Constitutional Grounds.   What's odd is I can not find a single group of people, other than Congress that want such a law...

I'm not too worried about the Federal Felony Rap.   It's a federal offense to carjack in the U.S. (Since 1992), but how many people have been charged under this statute outside of Washington, D.C.?   I don't know, but the number is very very small.   Although... the DOJ and State's Federal

Prosecuters do seem more intent on prosecuting petty offenses like people violating the Fair Housing Act when renting a room over their garage, and harrassing Indian Casinos, rather than going after violent predicate felons...so who knows?

Mark

And they (Politicians) still keep saying that the 9/11 event should NOT change the way we live.

BIG BROTHER IS HERE.

Looks like they might be putting the ones that help out the most during such disasters in jail. Then who are they going to call for emergency communications.

>From what I understand, the phrase "not readily accessible to the general public" is the legal description used to describe a signal that is

modulated by 'non-standard' means or incorportates encryption of some kind.

In other words, if it's a standard signal broadcast through the air using readily published modulation standards, then this law should NOT apply.

This law should NOT be automatically assumed to be a blanket prohibition against receiving broadcast transmissions.

Mike

I'm dead certain they don't want to prevent us from watching TV.

However, what would be the point, if not to further restrict our ability to listen to unencoded transmissions?

Sorry to be the bearer of bad news, but something of enormous importance to radio hobbyists has just happened in Washington, and so far I haven't seen any mention or discussion of it on any scanner or ham lists I follow.

I hope this message will alert others to what has just happened and get people thinking about the consequences...

The House just passed the Cyber Electronic Security Act last night (7/15/02) by an overwhelming margin of 385-3.

Buried in an otherwise draconian bill that raises penalties for computer hacking that causes death or serious injury to life in prison and allows government monitoring of communications and email without warrants in even more circumstances is the following seeming obscure language:

SEC. 108. PROTECTING PRIVACY.

(a) Section 2511- Section 2511(4) of title 18, United States Code, is amended--

(1) by striking paragraph (b); and

(2) by redesignating paragraph (c) as paragraph (b).

For those of you who don't realize what this means ....

Section 2511 subsection 4 of title 18 (the ECPA) currently reads as foilows.... the CESA will strike part (b) of this language.

Penalties..

(a)

Except as provided in paragraph (b) of this subsection or in subsection (5), whoever violates subsection (1) of this section shall be fined under this title or imprisoned not more than five years, or both.

[The following section will be eliminated by the new law...]

(b)

If the offense is a first offense under paragraph (a) of this subsection and is not for a tortious or illegal purpose or for purposes of direct or indirect commercial advantage or private commercial gain, and the wire or electronic communication with respect to which the offense under paragraph (a) is a radio communication that is not scrambled, encrypted, or transmitted using modulation techniques the essential parameters of which have been withheld from the public with the intention of preserving the privacy of such communication, then -

(i)

if the communication is not the radio portion of a cellular telephone communication, a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit, a public land mobile radio service communication or a paging service communication, and the conduct is not that described in subsection (5), the offender shall be fined under this title or imprisoned not more than one year, or both; and

(ii)

if the communication is the radio portion of a cellular telephone communication, a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit, a public land mobile radio service communication or a paging service communication, the offender shall be fined under this title.

What this does is change the penalty for the first offense of intercepting an unscrambled and unencrypted radio communication that is not supposed to be listened to (eg AMPS cellular calls, commercial pagers, cordless phones, common carrier communications) for hobby purposes (eg not a tortuous or illegal purpose or for direct or indirect commercial advantage or private commercial gain) from a misdemeanor (one year or less prison time) to a federal FELONY (5 years prison time).

And further this changes the status of the specific offense of listening to a cell call, cordless call, a pager, or a public land mobile radio service communication (eg a telephone interconnect) from a minor offense for which one can be fined a maximum of $500 to a federal FELONY for which one can be imprisoned for up to 5 years.

In effect this removes a safe harbor created during the negotiations over the ECPA back in 1985-86 which ensured that first offenses for hobby radio listening were only treated as minor crimes - after this law is passed simply intentionally tuning a common scanner to the (non-blocked) cordless phone frequencies could be prosecuted as a felony for which one could serve 5 years in jail.

And in case any of my readers have forgotten, a federal felony conviction (even without any jail time) deprives one of the right to vote, to own firearms, to be employed in a number of high level jobs and professions, to hold certain professional licenses and permits, and important for certain readers of these lists absolutely eliminates for life the possibility of holding any kind of security clearance whatever (a recent change in the rules) - something required for many if not most interesting government and government related jobs.

So merely being stopped by a cop with the cordless phone frequencies in your scanner could conceivably result in life long loss of important rights and privileges.

For some of you out there this may seem small potatoes and irrelevant since it merely changes the penalties for an already illegal act (which you are not supposed to be engaged in) and doesn't make anything new illegal.   But this is a rather naive view.

The federal government was certainly not going to prosecute a hobbyist for radio communications interception under the old version of the ECPA if the worst penalty that could be levied was a $500 fine - there simply is not the budget or the staff to prosecute people for what would be a very minor offense (equivalent of a speeding ticket).   And even prosecuting hobbyists for more serious interception (eg not cellular, cordless or pagers) was still a misdemeanor offense prosecution with jail time unlikely.

So in practice the only prosecutions were of people who clearly had a commercial purpose or otherwise engaged in egregious and public (eg the Newt call) conduct - no ever got prosecuted. And this was doubtless the intent of Congress back in 1985-86 - it would be illegal to monitor certain radio traffic but only a minor offense if you did so for hobby type personal curiosity or just to hack with the equipment or technology - and a serious felony if one engaged in such conduct for the purpose of committing a crime or gaining financial or commercial advantage (eg true spying or electronic eavesdropping).

But after this bill is signed into law (and clearly it will be), it will be quite possible for a federal prosecution of a hobbyist for illegal radio listening to be justified as a serious felony offense worth the time and effort and money to try and put in jail even if the offense is not for a commercial purpose or part of an illegal scheme. Thus "radio hacker" prosecutions have now become possible, and even perhaps probable.

And federal prosecutors and law enforcement agents get career advancement and attention from senior management in their agencies in direct proportion to the seriousness of the offense they are investigating and prosecuting - nobody ever advances to senior agent for going after jaywalkers, thus by raising the level of less than legal hobby radio monitoring offenses from a jaywalking class offense to a serious felony for which there can be real jail time it becomes much more interesting from a career perspective to prosecute radio .

And needless to say, such prosecutions would be shooting fish in a barrel type things given that many individuals are quite open on Internet newsgroups and mailing lists about their activities.

And of course this MAJOR change in the ECPA also has the effect of making the rather ambiguous and unclear meaning of "readily accessible to the general public" much more significant, since intercepting something that isn't readily accessible to the general public is now clearly a serious crime even if done for hobby purposes as a first offense.   Thus one has to be much more careful about making sure that the signal is a legal one...

And further than all of this, and perhaps even MUCH more significant to radio on Internet scanner lists ....

The careful, thoughtful reader will note that section 4 has been revised a bit lately, and that this new section 4 (see above) now makes it a federal felony with 5 years in jail penalties to violate section 1 INCLUDING the following provisions of section 1:

18 USC 2511:

(1)

Except as otherwise specifically provided in this chapter any person who -

(c)

intentionally discloses, or endeavors to disclose, to any other person the contents of any wire, oral, or electronic communication, knowing or having reason to know that the information was obtained through the interception of a wire, oral, or electronic communication in violation of this subsection;

(d)

intentionally uses, or endeavors to use, the contents of any wire, oral, or electronic communication, knowing or having reason to know that the information was obtained through the interception of a wire, oral, or electronic communication in violation of this subsection; or

shall be punished as provided in subsection (4) or shall be subject to suit as provided in subsection (5).

This seems to have changed the status of revealing as part of a hobby list any hint of the contents of a radio communications that might or might not have been legally intercepted from a potentially minor misdemeanor offense or less to a serious felony. Thus if a court finds that any communication reported on an Internet list was not legally intercepted, felony penalties apply for publishing the information even if the interception was for hobby purposes (which of course most scanner list intercepts are).

Most significant for many of us, the section 18 USC 2510 exceptions to the prohibitions on intercepting radio communications in 18 USC 2511 are pretty silent about military communications - not prohibited, or specifically allowed except as "governmental communications". So it is possible that military comms might be found to be illegal to intercept and thus passing around information about them a potential felony, even though of course the military has complete access to the world's best COMSEC technology and uses for anything sensitive. But in a paranoid age (post 9/11) anything goes... and if the government wants to go after scanner lists (like Milcom) it might now be able to do so with prosecutions with real teeth and jail time.

Thus the legal climate has fundamentally changed, and one can assume that since the Bush administration has been pushing for the passage of this bill that they perhaps intend to start prosecuting at least some category of radio under the new provisions - no doubt as an example meant to scare the rest of us into handing our radios in at the nearest police station...

So yet another blow to the radio hobbies.... and a big one indeed...

Personally I found the forward by Bob contains too much personal editorial
material for me to depend on it, just the facts jack.  A good article on
this topic would include pertinent text from the bill along with text of
being delete or modified in current codification of Federal law. Better
still it would present the text of the law as modified.-73

I've never heard of such a "test protocol" - good idea though!

One way may be to coordinate with another station, on another frequency.
Do the test off of 144.390 with one other station listening and
reporting back what they receive. Should do the trick for ya

My main goal is to ensure that the radio actually sends out the right
packets, on the right frequency. If I try to set it up on a different
frequency, then it adds one more variable that could be wrong if and when I
ever want to use the emergency mode...

Ah, but can you afford the lawyers to convince a non technical jury?
Being right means practically nothing in our legal system. Simply being
charged with having a "radio" that can SPY on things would be enough to
ruin your life..

As our society continues down the path of consumerism, and off the shelf
gizmos, with few people really understanding how it all works, we get to
the point that the only "correct" way to live is the way the advertisers
want you to live. That is, if you have a "wireless phone", or a Garage
door opener, or a cell phone, or a wireless LAN card, or a Satellite TV
receiver, or a BOOM box, or Stereo, or remote controlled Air Conditioner,
or any of dozens and dozens of products, then the public EXPECTS that such
device should ALWAYS work as advertized irregardless to the invisible RF
environment into which it is placed..

And anything that uses the RF spectrum in a way NOT INTENDED by the
advertiser, must be by definition, a subversive element in society that
must be brought to justice. Especially if such individual does not match
Vorizon's image of middle class heaven...

The RF spectrum is a very complex environment. RF engineers, and HAMS
know differently.. but that knowledge and $2.95 will at most get you a
cup of coffee..

Im not totally serious here.... but... it does make one wonder where the
RF spectrum is heading... and we will LOSE no matter how it goes...

I may be mistaken... In fact, I'm PROBABLY mistaken, but that's another
story... But I believe that 'definition' comes from already enacted law.
And what I may be mistaken about would be the communication act of
198x (whatever it was) that outlawed cellular snooping. I wouldn't be
surprised that it was just a 'cut and paste'.

Mike

Not a bad idea.

Some comparable devices:

Air raid sirens - usually the first X day of every month.

ELTs - the first five minutes of every hour for a period of no greater than 3
sweeps.

Perhaps the first five minutes of every hour with a packet count not to exceed
10?

Bob, any thoughts?

Terry

551. [aprssig] Filter for TCP incoming

From: "Hambuchen, Bob" <BHambuchen@littlerock.state.ar.us>
Date: Wed, 17 Jul 2002 10:02:28 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89762-2002.07.17-10.41.10--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anybody know a way to filter the incoming TCP traffic in some way in
WinAPRS ? When I open TCP, the station list fills within minutes to its
maximum of 4096 stations, even if the Station Time Out is set to .5 minutes.
I would like to filter, based upon distance from my home station, or at
least by
station type. Currently using WinAPRS ver 2.5.1, as I don't like 2.6.1's
square
map.

Thanks,
Bob

Rendered body type: text/plain

There was extensive discussion on this subject during the recent military
'tests' of a distress message sent via APRS.   I believe the general
consensus was that every packet should include TEST test in the text.

The 'down' side of this was that some systems separated the text from the
remainder. For more details take a look at the archives from about six
weeks ago.

'This is a test' or 'This is a drill' is common to those of us in the EMCOMM field - it is acceptable to make limited tests providing the test is announced in the same format and at the same as the distress message.

I am left wondering why you need to establish a PM in Emergency mode, though - use of this mode should be exceptional, and the D700 includes an acknowledgement step to verify that you want to broadcast in emergency mode. I use a D700 in an ERV, and on the sole occasion that I used the emergency mode (on scene, on my own, in a remote location, no 2M contact, no cell phone contact, no public service radio contact, at a vehicle roll-over with children trapped) the best response I got was an email three days later asking how I was.

My view on this (as a police officer, firefighter & emt, County RACES officer) is that the emergency mode should be used to warn other locals of an emergency scene in the area, and not as a 'call for help', much the same way as some radar detectors now have 'safety messages' warning of accidents etc.

AFilter provides a filtered TCP/IP stream. You can configure it to only display stations within a radius of a specified, Lat, Lon and more. It can be downloaded from http://www.wa6oft.com/dnld.htm

```
I am getting an emergency beacon from KC8QQF near Dayton.  See the link
below.  I sent a Query but have not seen a reply.  Here is a good chance to
test response capability. Anyone near Dayton?

```
John and the group

  Just saw this.  Last position on the Emergency Page 19 1/2 hours ago, FINDU for KC8QQF shows a
position in the last few minutes.

I'm at work with no RF or Long Distance phone capability, I've e-mailed a couple of folks in the area of
 the beacon and will try to see if I can get someone locally to come up on RF and see if they can
resolve this.

I seem to be missing something here.. I am not decoding an
"Emergency" with the Mic-E APRSdecoder, but rather a Message=
/M5/Special

Why is the Emergency page listing it as an Emergency? Someone
straighten me out please, :-)

I'm just speculating without enough infomration (i.e., do you mean that you've copied one of his recent packets and it decoded that way?) My guess is that since the time heard on the Emergency Page is almost 20 hours old right now is that this was an isolated event, and what you are hearing or seeing on FINDU.COM right now is his current settings.

Haven't heard anything from anyone I've pinged, but my guess is that this was a mistake,or, if there was some sort of emergency, it's long over by now, but I will continue follow up just to make sure.

I copied and pasted the raw data from the Emergency Page displayed
by Findu.com and let the APRSdec.exe decode it. I think the time
elasped had been on 3 or 4 minutes! So it is current...

I'm getting the same here near Seattle with Xastir on the internet
feeds.  It decodes as "Special", and I've received no other type of
packet from that station in 5 days, 16 hours of uptime connected to
the same feeds.

After decoding the last 24 hours of this station's beacons, it
appears there isn't and hasn't been any "Emergency" beacon
transmitted...

The D700 _will_ cause APRS monitors to "Highlight" thier Icon with a
beacon of Priority, Special, or Emergency.. It would seem this
station may be a newbee and is not aware of his settings and is
learning as we all do, :-) At least he didn't actually set it as an
Emerceny after all....

I noticed that KC81QF is reporting the same position as KC8QQF. Seems to
be a mangled call. If the call sign can get mangled so can the status.
Both packets appear to have been gated by WB8WNQ.

According to FindU there are what appears to be a number of mangled calls
coming from this same area. Try
http://www.findu.com/cgi-bin/near.cgi?call=KC81QF and then look for
multiple stations at the same distance from KC81QF

I noticed a similar occurence near Minneapolis, MN in the last few days.
Either there is a defective application causing this problem or a TNC
setup problem is appearing in multiple locations.

Bill KC9XG

See: http://4.46.81.200/lookup.apl?callsign=KC8QQF&range=20&Submit=Near
There is no callsign filtering on for back characters. You will see a very
large number of mangles callsigns near KC8QQF. Why? Does a digi or other
TNC in this area have PASSALL turned on? Brent KH2Z

We are losing all sorts of freedoms these days, so it doesn't suprise me that they will slowly start to come after our hobby. How would such a law be enforced? It seems unlikely, for now, that the FCC will place an agent in every home to make sure there is no monitoring of the forbidden frequencies. What does seem likely is that future tranceivers and receivers will not have any wideband receive capability, even though the current models can't legally receive the cellular portions of the 800 MHz band anyway. Even worse would be the banning of anything that could receive or be modified to receive what it is not supposed to. If it was already a misdemeanor to listen in on this stuff, then why aren't the products already regulated? The only logical motivation to enact this legislation, that I can think of, is to keep the terrorists from listening in on our law enforcement and emergency reaction infrastructure. It can't be to ensure cell phone users' privacy, since the government has already thrown that out the window. Based on current and furture laws like this, one can only come to the conclusion that the government believes the general public can't be trusted and must be restricted in any way necessary to support public safety. Just one more thing to add to the list...

strange that there is talk to have civilian spies -- watching for unusual activities and reporting them to FEMA --- but now to make it a felony to listen to open trransmitted communicatons flys in the face of the current hightened security concerns.

Rendered body type: text/plain

```
To get my APRS to speak on an old 25 MHz DOS laptop, I added 8 resistors
to the LPT1 port and now have a voice capability.  To facilitate this
process, I wrote a little general purpose BASIC program to help you
manipulate it.  ftp://tapr.org/aprssig/dosstuff/APRSdos/wavetest.zip

You record a WAVE file  on any modern machine and then WAVETEST.EXE
will let you play it back, spell words, and VIEW the waveform so that you
can index individual syllables and words.  I know its kind-of retro, but
with so many old DOS PC's laying around and so many things that can be
done, I thought someone else might have a use for it... since 8 resistors
can be added to ANY PC to give it a voice...

READ the law, or the proposed law.

That is NOT what it says.

Geesh!!!!

Mike

I don't know about your kneck of the woods, but around here, a 386 or 486 PC is becoming a rarity.

Two years ago I showed up at a hamfest with almost two dozen cleaned-up & working 386 and 486 machines, all with NIC's, hard drives, and VGA cards, and we managed to GIVE two of them away. Yes, we could not even GIVE them away. The Boy Scouts wouldn't even take them for their semi-annual computer swap meet. A local business that specializes in refurbished computers came over and took less than an armful of parts (mostly memory and a 2X CD ROM Drive). The rest went to the county landfill.

It seems to me that Hams are the biggest computer snobs around, if it ain't got a P4 or an Athlon processor with a Gig of DDR RAM, well...they're not interested, at any price.

73,

Mark

Rendered body type: text/plain

At work they have a street pilot-III color. It comes with a cable to a cigarette adapter with a SPEAKER in it so it can give voice directions. Does this cable/gizmo have the NMEA wires in it too, so I can splice in the Kenwood cable there?

Bob

Actually, same here as far as BOXES goes.  But everything I do now is only
on LAPTOPS.   Small, portable, low power, quick boot, throwaways...
Typically Ill give $10 for them at hamfests and can bring home as many as
I need...  Plus, they fit anywhere and run on 12 volts plus or minus...
Neat project controllers.... now they can talk on the radio too....

Yes.  If you buy the cable with the computer DB-9 connector on it, cut the
DB-9 off and put the 3/32 stereo connector right on the end.  Or buy the
Pfranc connector and build your own.  http://www.pfranc.com/  The cigarette
lighter cable by itself won't work for NMEA, and the data only cable won't
work for 12V power.  They completely leave out the unneeded wires.  You have
to buy their combination power/data cable or their hardwire cable (both of
which garmin is really proud of). I have a pile of garmin cables around
here.  I use the garmin combo cable in the house, the Pfranc cable in the
truck, and 2 hardwire cables for the motorcycles.

Consult your manual for instructions on how to output NMEA sentences.  It's
one of the settings.

That's because all those hams have 386/486s desktops at home (they are
probably the only ones that do ...)and they are looking to finally upgrade.
```

Had you gone to the swap meet with P200s or better or even 386/486 laptops
... they would probably have gone quickly and actually made you some money
... desktops 386/486 aren't even boat anchors anymore.

576. [aprssig] British Columbia DOS MAP

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 17 Jul 2002 21:49:22 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89895-2002.07.17-21.27.53--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In prep for the RAC National Convention in Vernon BC, I made a new 170 mile DOS map centered on Vernon. It is in NWMAPS27.ZIP.

For APRSdos users, here is how to add it to your system.

1) Download ftp://tapr.org/aprssig/dosstuff/APRSdos/nwmaps27.zip
2) PKUNZIP -DN NWMAPS27.ZIP into your APRS directory.

This gives you new copies of the following files (plus a complete download of the NW maps if you didnt have them before:

APRS\MAPLISTS\MAPLIST.USA
APRS\MAPLISTS\MAPLIST.APR
APRS\MAPLISTS\MAPLIST.NW
APRS\MAPS\Alberta.MAP
APRS\MAPS\BCVernon.MAP

Notice that since it is a big area map, I actually added it to the main MAPS directory for future standard distribution with the basic APRSdos standard distribution and added it to the master MAPLIST.USA and .APR files. But I figured it was easier to put it in the 370K NWmaps distribtion file instead of having everyone download a new APRSdos version of 1.3M just for the new map...

But BCvernon and the updated ALBERTA map will be in all future versions of APRSdos... (not the present 852)...

Message-ID: <LYR842-89899-2002.07.17-21.54.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We have had a couple of "real" emergency beacons transmitted here on our NW APRS Network during the last year. Fortunately, they turned out to be signals sent out in error. Our members did the right thing, they tried to contact the station sending out the emergency beacon. When that failed, they called 911 and got the Sheriff involved. That is the correct course of action. Do not assume that it was a false beacon. A life could be at stake. If you call it in to the Sheriff, please send out a bulleting to let everyone else know that the authorities have been notified!

The mistake that the people made when they sent out the emergency beacon was, they said oops and shut their radios off! That is the worst thing that you can do. Yes, we all make mistakes at some time or another. If you sent out an emergency beacon by mistake, please:

1. Try to send out a bulleting informing everyone of the error and to ignore the emergency transmission.

2. If you don't remember how to send a bulleting from you TH-D7 or D700, then send a message to any station, even your home station stating that you made a mistake and to ignore your last transmission. Others will be looking at the message page to try to determine more info on that emergency transmission.

3. Above all, DO NOT SHUT YOUR RADIO OFF! Before calling 911, the receiving station should attempt to send an APRS message to the station originating that emergency beacon and try to determine what the problem is and if it is for real, what type of assistance is really required. Sure makes it easier for the local Sheriff to know what he has to respond to and what kind of resources he will need.

As far as testing the response to an emergency APRS beacon, I intend to utilize this function in our next SAR Mock Search in Mason County, WA. I will of course clear it with the Sheriff and our DEM staff first, but my intent is to not inform anyone else and not inform the 911 center. The test would be to determine how long it would take to get someone to take action and call 911 and also to determine how the 911 center would respond to such an emergency. I have briefed our county's 911 Center Supervisor on APRS and its capabilities. I also instructed them to contact me whenever they get any call about an APRS emergency or an emergency where they were only given the Lat/Long for a location, that way I could assist them in determining the location and possibly the particulars on the APRS emergency. This is something I would encourage other counties to incorporate into one of their local emergency drills.

As far as conducting a test of the emergency beacon for your own education, please don't do it on 144.39! Use a low level transmission from you D7A or D700 near your home station or another APRS station on a simplex frequency other than 144.39. Also put a message string in the transmission that states: TESTING, IGNORE THIS TRANSMISSION. You never know, someone could have a packet station on that frequency and read your emergency beacon string!

Rendered body type: text/plain

I sem to have lost the capability to communicate between my etrex and my kpc3+.

The etrex is set for 4800 baud NMEA. I am running APRSdos (maybe 840). I can communicate from the laptop to the KPC3. I transmit and receive, but cannot get positions from the etrex into the laptop.

I have a pigtale from the db9 on the kpc3 for the gps, it did work. I have checked for broken wires. I do plan to remove the kpc3 from the setup and substitute another for it to see if maybe something in the tnc is haywire.

Suggestions are appreciated. And Thanks in advance.

579. [aprssig] aprsd inserting qAR in the path, anyone know what it is?

From: bob evinger <wd9eka@evinger.com>
Date: Wed, 17 Jul 2002 23:01:38 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89909-2002.07.17-23.40.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I had someone ask me what the 'qAR' was in the path when I am gating ISS packets. I thought maybe it was everyone but it looks like only packets that I gate are listing them. An example from ariss.net follows

```
00:14:54:42 : KF4UUL]CQ,RS0ISS*,qAR,WD9EKA-15*:Wayne Spartanburg SC
```

I dont believe I am doing anything specific to insert it. My guess is it a result of my 2 aprsd processes passing things along but the truth is I just dont know.

Any other aprsd admins out there know where it is coming from?

Rendered body type: text/plain

According to the APRSD documentation, here are examples of the different codes:

```
qAC,WA4ABC     from validated internet Client WA4ABC
qAX,WA4ABC     from unvalidated client
qAR,WA4DSY     from local TNC (RF)
qAS,first2C9   from Server/Hub first.aprs.net
qAU,WA4DSY     from UDP port
```

```
qAI,WA4DSY     from Internal source (server beacon, etc)
qAZ,WA4DSY     from Internal source that should not be repeated (server
status messages)

Cheers,
Tino - VE6SZR

```
Well, first, I would check that 2-way pig tail, just plug it into the com
port, fire up the GPS and start up HyperTerminal.  Once you have it set up,
plug the GPS's data cable into one side of the "Y", check for data comming
in on the terminal window.  Unplug it and plug it into the other side of
the "Y" and check for the data again.  If you get both ways, then you know
the "Y" is ok.  After that, I would start with a HARD RESET of the KPC+, in
Hyperterminal, set the INTFACE for TERMINAL and then let APRS re-configure
it to the standard APRS settings.

That's a start.
Good luck 73's

I suggest you try fresh batteries.   Serial communication takes a
heavier toll on all devices.  When voltage is down, signal levels
suffer.  A threshold is reached to cause port devices to not hear
```

```
each other.  It is not uncommon for a GPS to continue to operate
with a normal LCD display, while the serial output amplitude falls
below a point where it cannot drive the next device.

Well, not using same setup as you are planning, but a Baycom together with
Pentium Pro 150 MHz 128MB , Win 98 and UI-View. This seems to give lots of
resources left for my MP3 music server running om the same PC.

I had problems with another (newer) PC not giving 5V out on the serial port.
3V was not enough to drive the modem.

585. [aprssig] WinAPRS 2.6.1 Full Screen Map View

From: "Joseph Brassard" <brassardjn@att.net>
Date: Thu, 18 Jul 2002 10:41:7
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-89988-2002.07.18-11.19.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Winaprs 2.6.1 Full Screen Map View

I've observed several postings regarding the inability to acquire a full screen map with 2.6.1.
I have been successful in getting a full screen view.

1. With the mouse point and click to an area of the map you wish to enlarge.
2. Then click on the 'Zoom In' button on the tool bar, at least once, or 'Page Down'.
3. From the 'Precision Mapping Window' click on the 'Maximize' button.
4. At top of screen, go to 'Windows'. From the drop down menu, select 'New Map Prec Mapping'. This should give you the full screen view.
5. With the new map, again click on the area you wish to enlarge.
6. Then click on the 'Zoom In' button on the tool bar or 'Page Down' or Page Up'.

But some problems remain. Here are a few I have noticed:
1. Stations not always appearing where they should be.
2. When paging up or down, the map wanders to a different location (intermittent).
3. The map view defaults to the small square map view when changing to another screen such as 'Station List' or 'Message List' and then return to the map view. Must start the entire process over to enlarge the map view.

Hope this can help someone find a resolution to the instability of this program.

Joe,
Yes this did open up at full screen map. But, none of the stations showed at their correct locations on either the full screen of the square screen that I started with. Closed the full screen and now the square screen shows everyone back where they should be.
1. Joe what do you do when stations aren't in correct location?
2. While in full screen I was unable to zoom in?

Tnx & 73,
Dave
